The PAUSE instruction may also cause a VM exit outside of an enclave if the “PAUSE-loop exiting” VM-execution control is 1, but as the “PAUSE-loop exiting” control is ignored at CPL > 0 (see Section 25.1.3), VM exit from an enclave due to the 1-setting of “PAUSE-LOOP exiting” will never occur.

#### NOTE

It is expected that VMMs that virtualize Intel SGX will not set “PAUSE exiting” to 1.

### 38.6.4 INT 3 Behavior Inside an Enclave

INT3 is legal inside an enclave, however, the behavior inside an enclave is different from its behavior outside an enclave. See Section 42.4.1 for details.

### 38.6.5 INVD Handling when Enclaves Are Enabled

Once processor reserved memory protections are activated (see Section 38.5), any execution of INVD will result in a #GP(0).

## 26. Updates to Chapter 40, Volume 3D

Change bars show changes to Chapter 40 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D: System Programming Guide, Part 4*.

-----  
Changes to this chapter: Various updates throughout chapter regarding Intel SGX and new Intel SGX VM Over-subscription feature.

## CHAPTER 40

# SGX INSTRUCTION REFERENCES

This chapter describes the supervisor and user level instructions provided by Intel® Software Guard Extensions (Intel® SGX). In general, various functionality is encoded as leaf functions within the ENCLS (supervisor), ENCLU (user), and the ENCLV (virtualization operation) instruction mnemonics. Different leaf functions are encoded by specifying an input value in the EAX register of the respective instruction mnemonic.

### 40.1 INTEL® SGX INSTRUCTION SYNTAX AND OPERATION

ENCLS, ENCLU and ENCLV instruction mnemonics for all leaf functions are covered in this section.

For all instructions, the value of CS.D is ignored; addresses and operands are 64 bits in 64-bit mode and are otherwise 32 bits. Aside from EAX specifying the leaf number as input, each instruction leaf may require all or some subset of the RBX/RCX/RDX as input parameters. Some leaf functions may return data or status information in one or more of the general purpose registers.

#### 40.1.1 ENCLS Register Usage Summary

Table 40-1 summarizes the implicit register usage of supervisor mode enclave instructions.

**Table 40-1. Register Usage of Privileged Enclave Instruction Leaf Functions**

| Instr. Leaf | EAX       | RBX                | RCX              | RDX                 |
|-------------|-----------|--------------------|------------------|---------------------|
| ECREATE     | 00H (In)  | PAGEINFO (In, EA)  | EPCPAGE (In, EA) |                     |
| EADD        | 01H (In)  | PAGEINFO (In, EA)  | EPCPAGE (In, EA) |                     |
| EINIT       | 02H (In)  | SIGSTRUCT (In, EA) | SECS (In, EA)    | EINITTOKEN (In, EA) |
| EREMOVE     | 03H (In)  |                    | EPCPAGE (In, EA) |                     |

| EACCEPTCOPY           | 07H (In)       | SECINFO (In, EA)    | EPCPAGE (In, EA)    | EPCPAGE (In, EA)    |
| EA: Effective Address |                |                     |                     |                     |

## 40.1.3 ENCLV Register Usage Summary

Table 40-3 summarizes the implicit register usage of virtualization operation enclave instructions.

**Table 40-3. Register Usage of Virtualization Operation Enclave Instruction Leaf Functions**

| Instr. Leaf           | EAX      | RBX              | RCX              | RDX                    |
|-----------------------|----------|------------------|------------------|------------------------|
| EDECvirtchild         | 00H (In) | EPCPAGE (In, EA) | SECS (In, EA)    |                        |
| EINCvirtchild         | 01H (In) | EPCPAGE (In, EA) | SECS (In, EA)    |                        |
| ESETCONTEXT           | 02H (In) |                  | EPCPAGE (In, EA) | Context Value (In, EA) |
| EA: Effective Address |          |                  |                  |                        |

## 40.1.4 Information and Error Codes

Information and error codes are reported by various instruction leaf functions to show an abnormal termination of the instruction or provide information which may be useful to the developer. Table 40-4 shows the various codes and the instruction which generated the code. Details of the meaning of the code is provided in the individual instruction.

**Table 40-4. Error or Information Codes for Intel® SGX Instructions**

| Name                    | Value | Returned By  |
|-------------------------|-------|--|
| No Error                | 0     |  |
| SGX_INVALID_SIG_STRUCT  | 1     | EINIT  |
| SGX_INVALID_ATTRIBUTE   | 2     | EINIT, EGETKEY   |
| SGX_BLSTATE             | 3     | EBLOCK   |
| SGX_INVALID_MEASUREMENT | 4     | EINIT  |
| SGX_NOTBLOCKABLE        | 5     | EBLOCK   |
| SGX_PG_INVLD            | 6     | EBLOCK, ERDINFO, ETRACKC   |
| SGX_EPC_PAGE_CONFLICT   | 7     | EBLOCK, EMODPR, EMODT, ERDINFO, EDECvirtchild, EINCvirtchild, ELDBC, ELDUC, ESETCONTEXT, ETRACKC |

**Table 40-4. Error or Information Codes for Intel® SGX Instructions**

| Name                         | Value | Returned By                  |
|------------------------------|-------|------------------------------|
| SGX_INVALID_SIGNATURE        | 8     | EINIT                        |
| SGX_MAC_COMPARE_FAIL         | 9     | ELDB, ELDU, ELDBC, ELDUC     |
| SGX_PAGE_NOT_BLOCKED         | 10    | EWB                          |
| SGX_NOT_TRACKED              | 11    | EWB, EACCEPT                 |
| SGX_VA_SLOT_OCCUPIED         | 12    | EWB                          |
| SGX_CHILD_PRESENT            | 13    | EWB, EREMOVE                 |
| SGX_ENCLAVE_ACT              | 14    | EREMOVE                      |
| SGX_ENTRYEPOCH_LOCKED        | 15    | EBLOCK                       |
| SGX_INVALID_EINITTOKEN       | 16    | EINIT                        |
| SGX_PREV_TRK_INCMPL          | 17    | ETRACK, ETRACKC              |
| SGX_PG_IS_SECS               | 18    | EBLOCK                       |
| SGX_PAGE_ATTRIBUTES_MISMATCH | 19    | EACCEPT, EACCEPTCOPY         |
| SGX_PAGE_NOT_MODIFIABLE      | 20    | EMODPR, EMODT                |
| SGX_PAGE_NOT_DEBUGGABLE      | 21    | EDBGRD, EDBGWR               |
| SGX_INVALID_COUNTER          | 25    | EDECVIRTCHILD, EINCVIRTCHILD |
| SGX_PG_NONEPC                | 26    | ERDINFO                      |
| SGX_TRACK_NOT_REQUIRED       | 27    | ETRACKC                      |
| SGX_INVALID_CPUSVN           | 32    | EINIT, EGETKEY               |
| SGX_INVALID_ISVSVN           | 64    | EGETKEY                      |
| SGX_UNMASKED_EVENT           | 128   | EINIT                        |
| SGX_INVALID_KEYNAME          | 256   | EGETKEY                      |

### 40.1.5 Internal CREGs

The CREGs as shown in Table 5-4 are hardware specific registers used in this document to indicate values kept by the processor. These values are used while executing in enclave mode or while executing an Intel SGX instruction. These registers are not software visible and are implementation specific. The values in Table 40-5 appear at various places in the pseudo-code of this document. They are used to enhance understanding of the operations.

**Table 40-5. List of Internal CREG**

| Name                     | Size (Bits) | Scope |
|--------------------------|-------------|-------|
| CR_ENCLAVE_MODE          | 1           | LP    |
| CR_DBGOPTIN              | 1           | LP    |
| CR_TCS_LA                | 64          | LP    |
| CR_TCS_PA                | 64          | LP    |
| CR_ACTIVE_SECS           | 64          | LP    |
| CR_ELRange               | 128         | LP    |
| CR_SAVE_TF               | 1           | LP    |
| CR_SAVE_FS               | 64          | LP    |
| CR_GPR_PA                | 64          | LP    |
| CR_XSAVE_PAGE_n          | 64          | LP    |

| CR_SEAL_FUSES          | 128         | PACKAGE |

## 40.1.6 Concurrent Operation Restrictions

Under certain conditions, Intel SGX disallows certain leaf functions from operating concurrently. Listed below are some examples of concurrency that are not allowed.

- For example, Intel SGX disallows the following leaves to concurrently operate on the same EPC page.
  - ECREATE, EADD, and EREMOVE are not allowed to operate on the same EPC page concurrently with themselves.
  - EADD, EEXTEND, and EINIT leaves are not allowed to operate on the same SECS concurrently.
- Intel SGX disallows the EREMOVE leaf from removing pages from an enclave that is in use.
- Intel SGX disallows entry (EENTER and ERESUME) to an enclave while a page from that enclave is being removed.

When disallowed operation is detected, a leaf function may do one of the following:

- Return an SGX\_EPC\_PAGE\_CONFLICT error code in RAX.
- Cause a #GP(0) exception.

To prevent such exceptions, software must serialize leaf functions or prevent these leaf functions from accessing the same EPC page.

### 40.1.6.1 Concurrency Tables of Intel® SGX Instructions

The tables below detail the concurrent operation restrictions of all SGX leaf functions. For each leaf function, the table has a separate line for each of the EPC pages the leaf function accesses.

For each such EPC page, the base concurrency requirements are detailed as follows:

- Exclusive Access** means that no other leaf function that requires either shared or exclusive access to the same EPC page may be executed concurrently. For example, EADD requires an exclusive access to the target page it accesses.
- Shared Access** means that no other leaf function that requires an exclusive access to the same EPC page may be executed concurrently. Other leaf functions that require shared access may run concurrently. For example, EADD requires a shared access to the SECS page it accesses.
- Concurrent Access** means that any other leaf function that requires any access to the same EPC page may be executed concurrently. For example, EGETKEY has no concurrency requirements for the KEYREQUEST page.

In addition to the base concurrency requirements, additional concurrency requirements are listed, which apply only to specific sets of leaf functions. For example, there are additional requirements that apply for EADD, EXTEND and EINIT. EADD and EEXTEND can't execute concurrently on the same SECS page.

The tables also detail the leaf function's behavior when a conflict happens, i.e., a concurrency requirement is not met. In this case, the leaf function may return an SGX\_EPC\_PAGE\_CONFLICT error code in RAX, or it may cause an exception. In addition, the tables detail those conflicts where a VM Exit may be triggered, and list the Exit Qualification code that is provided in such cases.

Table 40-6. Base Concurrency Restrictions

| Leaf          | Parameter  |                           | Base Concurrency Restrictions |                       |                                    |
|---------------|------------|---------------------------|-------------------------------|-----------------------|------------------------------------|
|               |            |                           | Access                        | On Conflict           | SGX_CONFLICT VM Exit Qualification |
| EACCEPT       | Target     | [DS:RCX]                  | Shared                        | #GP                   |                                    |
|               | SECINFO    | [DS:RBX]                  | Concurrent                    |                       |                                    |
| EACCEPTCOPY   | Target     | [DS:RCX]                  | Concurrent                    |                       |                                    |
|               | Source     | [DS:RDX]                  | Concurrent                    |                       |                                    |
|               | SECINFO    | [DS:RBX]                  | Concurrent                    |                       |                                    |
| EADD          | Target     | [DS:RCX]                  | Exclusive                     | #GP                   | EPC_PAGE_CONFLICT_EXCEPTION        |
|               | SECS       | [DS:RBX]PAGEINFO.<br>SECS | Shared                        | #GP                   |                                    |
| EAUG          | Target     | [DS:RCX]                  | Exclusive                     | #GP                   | EPC_PAGE_CONFLICT_EXCEPTION        |
|               | SECS       | [DS:RBX]PAGEINFO.<br>SECS | Shared                        | #GP                   |                                    |
| EBLOCK        | Target     | [DS:RCX]                  | Shared                        | SGX_EPC_PAGE_CONFLICT |                                    |

### Description

The ENCLS instruction invokes the specified privileged Intel SGX leaf function for managing and debugging enclaves. Software specifies the leaf function by setting the appropriate value in the register EAX as input. The registers RBX, RCX, and RDX have leaf-specific purpose, and may act as input, as output, or may be unused. In 64-bit mode, the instruction ignores upper 32 bits of the RAX register.

The ENCLS instruction produces an invalid-opcode exception (#UD) if CR0.PE = 0 or RFLAGS.VM = 1, or if it is executed in system-management mode (SMM). Additionally, any attempt to execute the instruction when CPL > 0 results in #UD. The instruction produces a general-protection exception (#GP) if CR0.PG = 0 or if an attempt is made to invoke an undefined leaf function.

In VMX non-root operation, execution of ENCLS may cause a VM exit if the “enable ENCLS exiting” VM-execution control is 1. In this case, execution of individual leaf functions of ENCLS is governed by the ENCLS-exiting bitmap field in the VMCS. Each bit in that field corresponds to the index of an ENCLS leaf function (as provided in EAX).

Software in VMX root operation can thus intercept the invocation of various ENCLS leaf functions in VMX non-root operation by setting the “enable ENCLS exiting” VM-execution control and setting the corresponding bits in the ENCLS-exiting bitmap.

Addresses and operands are 32 bits outside 64-bit mode (IA32\_EFER.LMA = 0 || CS.L = 0) and are 64 bits in 64-bit mode (IA32\_EFER.LMA = 1 || CS.L = 1). CS.D value has no impact on address calculation. The DS segment is used to create linear addresses.

Segment override prefixes and address-size override prefixes are ignored, and is the REX prefix in 64-bit mode.

### Operation

```

IF TSX_ACTIVE
    THEN GOTO TSX_ABORT_PROCESSING; FI;

IF CR0.PE = 0 or RFLAGS.VM = 1 or in SMM or CPUID.SGX_LEAF.0:EAX.SE1 = 0
    THEN #UD; FI;

IF (CPL > 0)
    THEN #UD; FI;

IF in VMX non-root operation and the “enable ENCLS exiting” VM-execution control is 1
    THEN
        IF EAX < 63 and ENCLS_exiting_bitmap[EAX] = 1 or EAX > 62 and ENCLS_exiting_bitmap[63] = 1
            THEN VM exit;
        FI;
    FI;

IF IA32_FEATURE_CONTROL.LOCK = 0 or IA32_FEATURE_CONTROL.SGX_ENABLE = 0
    THEN #GP(0); FI;

IF EAX is invalid leaf number)
    THEN #GP(0); FI;

```

IF CR0.PG = 0  
 THEN #GP(0); FI;

(\* DS must not be an expanded down segment \*)  
 IF not in 64-bit mode and DS.Type is expand-down data  
 THEN #GP(0); FI;

| NP 0F 01 D7<br>ENCLU   | NP    | V/V                          | SGX1                     | This instruction is used to execute non-privileged Intel SGX leaf functions. |

### Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Implicit Register Operands |
|-------|-----------|-----------|-----------|----------------------------|
| NP    | NA        | NA        | NA        | See Section 40.4           |

### Description

The ENCLU instruction invokes the specified non-privileged Intel SGX leaf functions. Software specifies the leaf function by setting the appropriate value in the register EAX as input. The registers RBX, RCX, and RDX have leaf-specific purpose, and may act as input, as output, or may be unused. In 64-bit mode, the instruction ignores upper 32 bits of the RAX register.

The ENCLU instruction produces an invalid-opcode exception (#UD) if CR0.PE = 0 or RFLAGS.VM = 1, or if it is executed in system-management mode (SMM). Additionally, any attempt to execute this instruction when CPL < 3 results in #UD. The instruction produces a general-protection exception (#GP) if either CR0.PG or CR0.NE is 0, or if an attempt is made to invoke an undefined leaf function. The ENCLU instruction produces a device not available exception (#NM) if CR0.TS = 1.

Addresses and operands are 32 bits outside 64-bit mode (IA32\_EFER.LMA = 0 or CS.L = 0) and are 64 bits in 64-bit mode (IA32\_EFER.LMA = 1 and CS.L = 1). CS.D value has no impact on address calculation. The DS segment is used to create linear addresses.

Segment override prefixes and address-size override prefixes are ignored, as is the REX prefix in 64-bit mode.

## ENCLV—Execute an Enclave VMM Function of Specified Leaf Number

| Opcode/<br>Instruction | Op/En | 64/32<br>bit Mode<br>Support | CPUID<br>Feature<br>Flag | Description   |
|------------------------|-------|------------------------------|--------------------------|---|
| NP OF 01 C0<br>ENCLV   | NP    | V/V                          | SGX1                     | This instruction is used to execute privileged SGX leaf functions that are reserved for VMM use. They are used for managing the enclaves. |

### Instruction Operand Encoding

| Op/En | Operand 1 | Operand 2 | Operand 3 | Implicit Register Operands |
|-------|-----------|-----------|-----------|----------------------------|
| NP    | NA        | NA        | NA        | See Section 40.3           |

### Description

The ENCLV instruction invokes the virtualization SGX leaf functions for managing enclaves in a virtualized environment. Software specifies the leaf function by setting the appropriate value in the register EAX as input. The registers RBX, RCX, and RDX have leaf-specific purpose, and may act as input, as output, or may be unused. In non 64-bit mode, the instruction ignores upper 32 bits of the RAX register.

The ENCLV instruction produces an invalid-opcode exception (#UD) if CR0.PE = 0 or RFLAGS.VM = 1, if it is executed in system-management mode (SMM), or not in VMX operation. Additionally, any attempt to execute the instruction when CPL > 0 results in #UD. The instruction produces a general-protection exception (#GP) if CR0.PG = 0 or if an attempt is made to invoke an undefined leaf function.

Software in VMX root mode of operation can enable execution of the ENCLV instruction in VMX non-root mode by setting enable ENCLV execution control in the VMCS. If enable ENCLV execution control in the VMCS is clear, execution of the ENCLV instruction in VMX non-root mode results in #UD.

When execution of ENCLV instruction in VMX non-root mode is enabled, software in VMX root operation can intercept the invocation of various ENCLS leaf functions in VMX non-root operation by setting the corresponding bits in the ENCLV-exiting bitmap.

Addresses and operands are 32 bits in 32-bit mode (IA32\_EFER.LMA == 0 || CS.L == 0) and are 64 bits in 64-bit mode (IA32\_EFER.LMA == 1 && CS.L == 1). CS.D value has no impact on address calculation.

Segment override prefixes and address-size override prefixes are ignored, as is the REX prefix in 64-bit mode.

### Operation

IF TSX\_ACTIVE

THEN GOTO TSX\_ABORT\_PROCESSING; FI;

## 40.3 INTEL® SGX SYSTEM LEAF FUNCTION REFERENCE

Leaf functions available with the ENCLS instruction mnemonic are covered in this section. In general, each instruction leaf requires EAX to specify the leaf function index and/or additional implicit registers specifying leaf-specific input parameters. An instruction operand encoding table provides details of each implicit register usage and associated input/output semantics.

In many cases, an input parameter specifies an effective address associated with a memory object inside or outside the EPC, the memory addressing semantics of these memory objects are also summarized in a separate table.

## EADD—Add a Page to an Uninitialized Enclave

| Opcode/<br>Instruction   | Op/En | 64/32<br>bit Mode<br>Support | CPUID<br>Feature<br>Flag | Description   |
|--------------------------|-------|------------------------------|--------------------------|---|
| EAX = 01H<br>ENCLS[EADD] | IR    | V/V                          | SGX1                     | This leaf function adds a page to an uninitialized enclave. |

### Instruction Operand Encoding

| Op/En | EAX       | RBX                        | RCX                                      |
|-------|-----------|----------------------------|--|
| IR    | EADD (In) | Address of a PAGEINFO (In) | Address of the destination EPC page (In) |

### Description

This leaf function copies a source page from non-enclave memory into the EPC, associates the EPC page with an SECS page residing in the EPC, and stores the linear address and security attributes in EPCM. As part of the association, the enclave offset and the security attributes are measured and extended into the SECS.MRENCLAVE. This instruction can only be executed when current privilege level is 0.

RBX contains the effective address of a PAGEINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of EADD leaf function.

### EADD Memory Parameter Semantics

| PAGEINFO                             | PAGEINFO.SECS                          | PAGEINFO.SRCPGE                      | PAGEINFO.SECINFO                     | EPCPAGE                           |
|--------------------------------------|--|--------------------------------------|--------------------------------------|-----------------------------------|
| Read access permitted by Non Enclave | Read/Write access permitted by Enclave | Read access permitted by Non Enclave | Read access permitted by Non Enclave | Write access permitted by Enclave |

The instruction faults if any of the following:

### EADD Faulting Conditions

|   |  |
|---|--|
| The operands are not properly aligned.    | Unsupported security attributes are set.   |
| Refers to an invalid SECS.                | Reference is made to an SECS that is locked by another thread.   |
| The EPC page is locked by another thread. | RCX does not contain an effective address of an EPC page.  |
| The EPC page is already valid.            | If security attributes specifies a TCS and the source page specifies unsupported TCS values or fields. |
| The SECS has been initialized.            | The specified enclave offset is outside of the enclave address space.                                  |

### Concurrency Restrictions

**Table 40-8. Base Concurrency Restrictions of EADD**

| Leaf | Parameter                  | Base Concurrency Restrictions |             |                                    |
|------|----------------------------|-------------------------------|-------------|------------------------------------|

Description

This leaf function zeroes a page of EPC memory, associates the EPC page with an SECS page residing in the EPC, and stores the linear address and security attributes in the EPCM. As part of the association, the security attributes are configured to prevent access to the EPC page until a corresponding invocation of the EACCEPT leaf or EACCEPT-COPY leaf confirms the addition of the new page into the enclave. This instruction can only be executed when current privilege level is 0.

RBX contains the effective address of a PAGEINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of the EAUG leaf function.

EAUG Memory Parameter Semantics

| PAGEINFO                             | PAGEINFO.SEC                           | PAGEINFO.SRCPGE | PAGEINFO.SECINFO                     | EPCPAGE                           |

## EBLOCK—Mark a page in EPC as Blocked

| Opcode/<br>Instruction     | Op/En | 64/32<br>bit Mode<br>Support | CPUID<br>Feature<br>Flag | Description  |
|----------------------------|-------|------------------------------|--------------------------|--|
| EAX = 09H<br>ENCLS[EBLOCK] | IR    | V/V                          | SGX1                     | This leaf function marks a page in the EPC as blocked. |

### Instruction Operand Encoding

| Op/En | EAX         |                         | RCX                                    |
|-------|-------------|-------------------------|--|
| IR    | EBLOCK (In) | Return error code (Out) | Effective address of the EPC page (In) |

### Description

This leaf function causes an EPC page to be marked as BLOCKED. This instruction can only be executed when current privilege level is 0.

The content of RCX is an effective address of an EPC page. The DS segment is used to create linear address. Segment override is not supported.

An error code is returned in RAX.

The table below provides additional information on the memory parameter of EBLOCK leaf function.

### EBLOCK Memory Parameter Semantics

|  |
|--|
| EPCPAGE                                |
| Read/Write access permitted by Enclave |

The error codes are:

**Table 40-12. EBLOCK Return Value in RAX**

| Error Code (see Table 40-4) | Description   |
|-----------------------------|---|
| No Error                    | EBLOCK successful.  |
| SGX_BLKSTATE                | Page already blocked. This value is used to indicate to a VMM that the page was already in BLOCKED state as a result of EBLOCK and thus will need to be restored to this state when it is eventually reloaded (using ELDB). |
| SGX_ENTRYPOCH_LOCKED        | SECS locked for Entry Epoch update. This value indicates that an ETRACK is currently executing on the SECS. The EBLOCK should be reattempted.   |
| SGX_NOTBLOCKABLE            | Page type is not one which can be blocked.  |
| SGX_PG_INVLD                | Page is not valid and cannot be blocked.  |
| SGX_EPC_PAGE_CONFLICT       | Page is being written by EADD, EAUG, ECREATE, ELDU/B, EMODT, or EWB.  |

### Concurrency Restrictions

**Table 40-13. Base Concurrency Restrictions of EBLOCK**

| Leaf   | Parameter       | Base Concurrency Restrictions |                       |                                    |

ECREATE—Create an SECS page in the Enclave Page Cache

| Opcode/<br>Instruction      | Op/En | 64/32<br>bit Mode<br>Support | CPUID<br>Feature<br>Flag | Description   |
|-----------------------------|-------|------------------------------|--------------------------|---|
| EAX = 00H<br>ENCLS[ECREATE] | IR    | V/V                          | SGX1                     | This leaf function begins an enclave build by creating an SECS page in EPC. |

Instruction Operand Encoding

| Op/En | EAX          | RBX                        | RCX                                       |
|-------|--------------|----------------------------|---|
| IR    | ECREATE (In) | Address of a PAGEINFO (In) | Address of the destination SECS page (In) |

Description

ENCLS[ECREATE] is the first instruction executed in the enclave build process. ECREATE copies an SECS structure outside the EPC into an SECS page inside the EPC. The internal structure of SECS is not accessible to software.

ECREATE will set up fields in the protected SECS and mark the page as valid inside the EPC. ECREATE initializes or checks unused fields.

Software sets the following fields in the source structure: SECS:BASEADDR, SECS:SIZE in bytes, ATTRIBUTES, CONFIGID and CONFIGSVN. SECS:BASEADDR must be naturally aligned on an SECS.SIZE boundary. SECS.SIZE must be at least 2 pages (8192).

The source operand RBX contains an effective address of a PAGEINFO structure. PAGEINFO contains an effective address of a source SECS and an effective address of an SECINFO. The SECS field in PAGEINFO is not used.

The RCX register is the effective address of the destination SECS. It is an address of an empty slot in the EPC. The SECS structure must be page aligned. SECINFO flags must specify the page as an SECS page.

ECREATE Memory Parameter Semantics

| PAGEINFO                             | PAGEINFO.SRCPGE                      | PAGEINFO.SECINFO                     | EPCPAGE                           |
|--------------------------------------|--------------------------------------|--------------------------------------|-----------------------------------|
| Read access permitted by Non Enclave | Read access permitted by Non Enclave | Read access permitted by Non Enclave | Write access permitted by Enclave |

ECREATE will fault if the SECS target page is in use; already valid; outside the EPC. It will also fault if addresses are not aligned; unused PAGEINFO fields are not zero.

If the amount of space needed to store the SSA frame is greater than the amount specified in SECS.SSAFRAME-SIZE, a #GP(0) results. The amount of space needed for an SSA frame is computed based on DS:TMP\_SECS.ATTRIBUTES.XFRM size. Details of computing the size can be found Section 41.7.

## EDBGRD—Read From a Debug Enclave

| Opcode/<br>Instruction     | Op/En | 64/32<br>bit Mode<br>Support | CPUID<br>Feature<br>Flag | Description   |
|----------------------------|-------|------------------------------|--------------------------|---|
| EAX = 04H<br>ENCLS[EDBGRD] | IR    | V/V                          | SGX1                     | This leaf function reads a dword/quadword from a debug enclave. |

### Instruction Operand Encoding

| Op/En | EAX         | RBX                                  | RCX                                      |
|-------|-------------|--------------------------------------|--|
| IR    | EDBGRD (In) | Data read from a debug enclave (Out) | Address of source memory in the EPC (In) |

### Description

This leaf function copies a quadword/doubleword from an EPC page belonging to a debug enclave into the RBX register. Eight bytes are read in 64-bit mode, four bytes are read in non-64-bit modes. The size of data read cannot be overridden.

The effective address of the source location inside the EPC is provided in the register RCX.

### EDBGRD Memory Parameter Semantics

|                                  |
|----------------------------------|
| EPCQW                            |
| Read access permitted by Enclave |

The error codes are:

**Table 40-17. EDBGRD Return Value in RAX**

| Error Code (see Table 40-4) | Description   |
|-----------------------------|---|
| No Error                    | EDBGRD successful.  |
| SGX_PAGE_NOT_DEBUGGABLE     | The EPC page cannot be accessed because it is in the PENDING or MODIFIED state. |

The instruction faults if any of the following:

### EDBGRD Faulting Conditions

|  |   |
|--|---|
| RCX points into a page that is an SECS.  | RCX does not resolve to a naturally aligned linear address.   |
| RCX points to a page that does not belong to an enclave that is in debug mode. | RCX points to a location inside a TCS that is beyond the architectural size of the TCS (SGX_TCS_LIMIT). |
| An operand causing any segment violation.                                      | May page fault.   |
| CPL > 0.   |   |

This instruction ignores the EPCM RWX attributes on the enclave page. Consequently, violation of EPCM RWX attributes via EDBGRD does not result in a #GP.

## Concurrency Restrictions

## EDBGWR—Write to a Debug Enclave

| Opcode/<br>Instruction     | Op/En | 64/32<br>bit Mode<br>Support | CPUID<br>Feature<br>Flag | Description  |
|----------------------------|-------|------------------------------|--------------------------|--|
| EAX = 05H<br>ENCLS[EDBGWR] | IR    | V/V                          | SGX1                     | This leaf function writes a dword/quadword to a debug enclave. |

### Instruction Operand Encoding

| Op/En | EAX         | RBX  | RCX                                      |
|-------|-------------|--|--|
| IR    | EDBGWR (In) | Data to be written to a debug enclave (In) | Address of Target memory in the EPC (In) |

### Description

This leaf function copies the content in EBX/RBX to an EPC page belonging to a debug enclave. Eight bytes are written in 64-bit mode, four bytes are written in non-64-bit modes. The size of data cannot be overridden.

The effective address of the source location inside the EPC is provided in the register RCX.

### EDBGWR Memory Parameter Semantics

|                                   |
|-----------------------------------|
| EPCQW                             |
| Write access permitted by Enclave |

The instruction faults if any of the following:

### EDBGWR Faulting Conditions

|  |   |
|--|---|
| RCX points into a page that is an SECS.  | RCX does not resolve to a naturally aligned linear address.       |
| RCX points to a page that does not belong to an enclave that is in debug mode. | RCX points to a location inside a TCS that is not the FLAGS word. |
| An operand causing any segment violation.                                      | May page fault.   |
| CPL > 0.   |   |

The error codes are:

**Table 40-20. EDBGWR Return Value in RAX**

| Error Code (see Table 40-4) | Description   |
|-----------------------------|---|
| No Error                    | EDBGWR successful.  |
| SGX_PAGE_NOT_DEBUGGABLE     | The EPC page cannot be accessed because it is in the PENDING or MODIFIED state. |

This instruction ignores the EPCM RWX attributes on the enclave page. Consequently, violation of EPCM RWX attributes via EDBGWR does not result in a #GP.

### Concurrency Restrictions

**Table 40-21. Base Concurrency Restrictions of EDBGWR**

| Leaf   | Parameter       | Base Concurrency Restrictions |             |                                    |

EEXTEND—Extend Uninitialized Enclave Measurement by 256 Bytes

| Opcode/<br>Instruction      | Op/En | 64/32<br>bit Mode<br>Support | CPUID<br>Feature<br>Flag | Description   |
|-----------------------------|-------|------------------------------|--------------------------|---|
| EAX = 06H<br>ENCLS[EEXTEND] | IR    | V/V                          | SGX1                     | This leaf function measures 256 bytes of an uninitialized enclave page. |

Instruction Operand Encoding

| Op/En | EAX          | EBX  | RCX   |
|-------|--------------|--|---|
| IR    | EEXTEND (In) | Effective address of the SECS of the data chunk (In) | Effective address of a 256-byte chunk in the EPC (In) |

Description

This leaf function updates the MRENCLAVE measurement register of an SECS with the measurement of an EXTEND string comprising of “EEXTEND” || ENCLAVEOFFSET || PADDING || 256 bytes of the enclave page. This instruction can only be executed when current privilege level is 0 and the enclave is uninitialized.

RBX contains the effective address of the SECS of the region to be measured. The address must be the same as the one used to add the page into the enclave.

RCX contains the effective address of the 256 byte region of an EPC page to be measured. The DS segment is used to create linear addresses. Segment override is not supported.

EEXTEND Memory Parameter Semantics

|                        |
|------------------------|
| EPC[RCX]               |
| Read access by Enclave |

The instruction faults if any of the following:

EEXTEND Faulting Conditions

|   |  |
|---|--|
| RBX points to an address not 4KBytes aligned. | RBX does not resolve to an SECS.                       |
| RBX does not point to an SECS page.           | RBX does not point to the SECS page of the data chunk. |
| RCX points to an address not 256B aligned.    | RCX points to an unused page or a SECS.                |
| RCX does not resolve in an EPC page.          | If SECS is locked.                                     |
| If the SECS is already initialized.           | May page fault.  |

|-------|------------|------------------|---------------------------|----------------------|----------------------------|
| IR    | EINIT (In) | Error code (Out) | Address of SIGSTRUCT (In) | Address of SECS (In) | Address of EINITTOKEN (In) |

### Description

This leaf function is the final instruction executed in the enclave build process. After EINIT, the MRENCLAVE measurement is complete, and the enclave is ready to start user code execution using the EENTER instruction.

EINIT takes the effective address of a SIGSTRUCT and EINITTOKEN. The SIGSTRUCT describes the enclave including MRENCLAVE, ATTRIBUTES, ISVSVN, a 3072 bit RSA key, and a signature using the included key. SIGSTRUCT must be populated with two values, q1 and q2. These are calculated using the formulas shown below:

$$q1 = \text{floor}(\text{Signature}^2 / \text{Modulus});$$

$$q2 = \text{floor}((\text{Signature}^3 - q1 * \text{Signature} * \text{Modulus}) / \text{Modulus});$$

The EINITTOKEN contains the MRENCLAVE, MRSIGNER, and ATTRIBUTES. These values must match the corresponding values in the SECS. If the EINITTOKEN was created with a debug launch key, the enclave must be in debug mode as well.

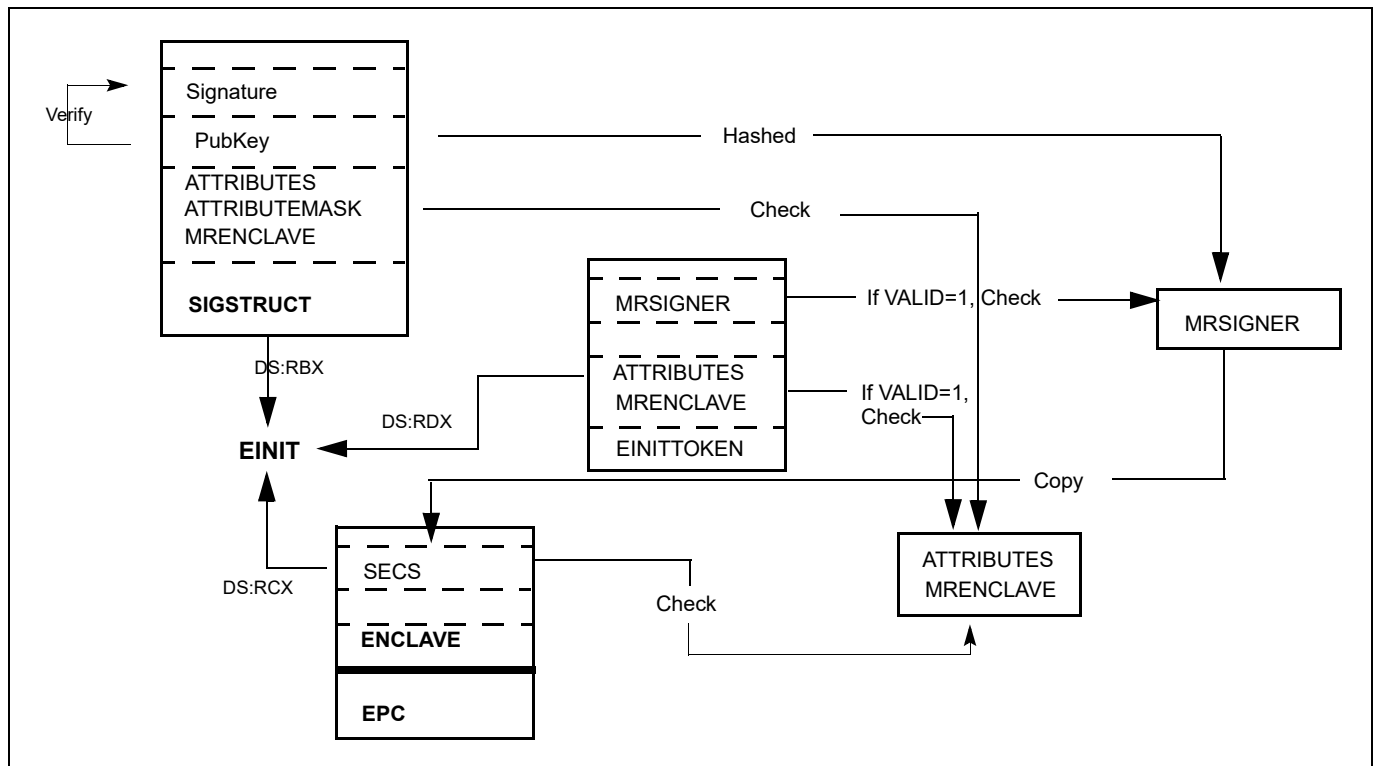

Figure 40-1. Relationships Between SECS, SIGSTRUCT and EINITTOKEN

**EINIT Memory Parameter Semantics**

| SIGSTRUCT             | SECS                         | EINITTOKEN            |
|-----------------------|------------------------------|-----------------------|
| Access by non-Enclave | Read/Write access by Enclave | Access by non-Enclave |

EINIT performs the following steps, which can be seen in Figure 40-1:

Validates that SIGSTRUCT is signed using the enclosed public key.

Checks that the completed computation of SECS.MRENCLAVE equals SIGSTRUCT.HASHENCLAVE.

Checks that no reserved bits are set to 1 in SIGSTRUCT.ATTRIBUTES and no reserved bits in SIGSTRUCT.ATTRIBUTESMASK are set to 0.

Checks that no controlled ATTRIBUTES bits are set in SIGSTRUCT.ATTRIBUTES unless the SHA256 digest of SIGSTRUCT.MODULUS equals IA32\_SGX\_LEPUBKEYHASH.

Checks that SIGSTRUCT.ATTRIBUTES equals the result of logically and-ing SIGSTRUCT.ATTRIBUTESMASK with SECS.ATTRIBUTES.

If EINITTOKEN.VALID is 0, checks that the SHA256 digest of SIGSTRUCT.MODULUS equals IA32\_SGX\_LEPUBKEYHASH.

If EINITTOKEN.VALID is 1, checks the validity of EINITTOKEN.

If EINITTOKEN.VALID is 1, checks that EINITTOKEN.MRENCLAVE equals SECS.MRENCLAVE.

If EINITTOKEN.VALID is 1 and EINITTOKEN.ATTRIBUTES.DEBUG is 1, SECS.ATTRIBUTES.DEBUG must be 1.

Commits SECS.MRENCLAVE, and sets SECS.MRSIGNER, SECS.ISVSVN, and SECS.ISVPRODID based on SIGSTRUCT.

Update the SECS as Initialized.

Periodically, EINIT polls for certain asynchronous events. If such an event is detected, it completes with failure code (ZF=1 and RAX = SGX\_UNMASKED\_EVENT), and RIP is incremented to point to the next instruction. These events includes external interrupts, non-maskable interrupts, system-management interrupts, machine checks, INIT signals, and the VMX-preemption timer. EINIT does not fail if the pending event is inhibited (e.g., external interrupts could be inhibited due to blocking by MOV SS blocking or by STI).

The following bits in RFLAGS are cleared: CF, PF, AF, OF, and SF. When the instruction completes with an error, RFLAGS.ZF is set to 1, and the corresponding error bit is set in RAX. If no error occurs, RFLAGS.ZF is cleared and RAX is set to 0.

The error codes are:

**Table 40-25. EINIT Return Value in RAX**

| Error Code (see Table 40-4) | Description   |
|-----------------------------|---|
| No Error                    | EINIT successful.   |
| SGX_INVALID_SIG_STRUCT      | If SIGSTRUCT contained an invalid value.  |
| SGX_INVALID_ATTRIBUTE       | If SIGSTRUCT contains an unauthorized attributes mask.  |
| SGX_INVALID_MEASUREMENT     | If SIGSTRUCT contains an incorrect measurement.<br>If EINITTOKEN contains an incorrect measurement. |
| SGX_INVALID_SIGNATURE       | If signature does not validate with enclosed public key.  |
| SGX_INVALID_LICENSE         | If license is invalid.  |
| SGX_INVALID_CPUSVN          | If license SVN is unsupported.  |
| SGX_UNMASKED_EVENT          | If an unmasked event is received before the instruction completes its operation.                    |

## Concurrency Restrictions

| IR    | ELDB/ELDU<br>(In) | Return error<br>code (Out) | Address of the PAGEINFO<br>(In) | Address of the EPC page<br>(In) | Address of the version-<br>array slot (In) |

Description

This leaf function copies a page from regular main memory to the EPC. As part of the copying process, the page is cryptographically authenticated and decrypted. This instruction can only be executed when current privilege level is 0.

The ELDB leaf function sets the BLOCK bit in the EPCM entry for the destination page in the EPC after copying. The ELDU leaf function clears the BLOCK bit in the EPCM entry for the destination page in the EPC after copying.

RBX contains the effective address of a PAGEINFO structure; RCX contains the effective address of the destination EPC page; RDX holds the effective address of the version array slot that holds the version of the page.

The ELDBC/ELDUC leafs are very similar to ELDB and ELDU. They provide an error code on the concurrency conflict for any of the pages which need to acquire a lock. These include the destination, SECS, and VA slot.

The table below provides additional information on the memory parameter of ELDB/ELDU leaf functions.

ELDB/ELDU/ELDBC/ELBUC Memory Parameter Semantics

| PAGEINFO                   | PAGEINFO.SRCPGE            | PAGEINFO.PCMD              | PAGEINFO.SECS                | EPCPAGE                                   | Version-Array Slot                          |
|----------------------------|----------------------------|----------------------------|------------------------------|---|---|
| Non-enclave<br>read access | Non-enclave read<br>access | Non-enclave read<br>access | Enclave read/write<br>access | Read/Write access<br>permitted by Enclave | Read/Write access per-<br>mitted by Enclave |

The error codes are:

Table 40-28. ELDB/ELDU/ELDBC/ELBUC Return Value in RAX

| Error Code (see Table 40-4) | Description             |
|-----------------------------|-------------------------|
| No Error                    | ELDB/ELDU successful.   |
| SGX_MAC_COMPARE_FAIL        | If the MAC check fails. |

## Concurrency Restrictions

EMODPR—Restrict the Permissions of an EPC Page

| Opcode/<br>Instruction     | Op/En | 64/32<br>bit Mode<br>Support | CPUID<br>Feature<br>Flag | Description  |
|----------------------------|-------|------------------------------|--------------------------|--|
| EAX = 0EH<br>ENCLS[EMODPR] | IR    | V/V                          | SGX2                     | This leaf function restricts the access rights associated with a EPC page in an initialized enclave. |

Instruction Operand Encoding

| Op/En | EAX         |                         | RBX                       | RCX                                      |
|-------|-------------|-------------------------|---------------------------|--|
| IR    | EMODPR (In) | Return Error Code (Out) | Address of a SECINFO (In) | Address of the destination EPC page (In) |

Description

This leaf function restricts the access rights associated with an EPC page in an initialized enclave. THE RWX bits of the SECINFO parameter are treated as a permissions mask; supplying a value that does not restrict the page permissions will have no effect. This instruction can only be executed when current privilege level is 0.

RBX contains the effective address of a SECINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of the EMODPR leaf function.

EMODPR Memory Parameter Semantics

| SECINFO                              | EPCPAGE                                |
|--------------------------------------|--|
| Read access permitted by Non Enclave | Read/Write access permitted by Enclave |

The instruction faults if any of the following:

EMODPR Faulting Conditions

|   |  |
|---|--|
| The operands are not properly aligned.    | If unsupported security attributes are set.                                      |
| The Enclave is not initialized.           | SECS is locked by another thread.  |
| The EPC page is locked by another thread. | RCX does not contain an effective address of an EPC page in the running enclave. |
| The EPC page is not valid.                |  |

The error codes are:

Table 40-31. EMODPR Return Value in RAX

| Error Code (see Table 40-4) | Description   |
|-----------------------------|---|
| No Error                    | EMODPR successful.  |
| SGX_PAGE_NOT_MODIFIABLE     | The EPC page cannot be modified because it is in the PENDING or MODIFIED state. |
| SGX_EPC_PAGE_CONFLICT       | Page is being written by EADD, EAUG, ECREATE, ELDU/B, EMODT, or EWB.            |

## ERDINFO—Read Type and Status Information About an EPC Page

| Opcode/<br>Instruction      | Op/En | 64/32<br>bit Mode<br>Support | CPUID<br>Feature<br>Flag | Description   |
|-----------------------------|-------|------------------------------|--------------------------|---|
| EAX = 10H<br>ENCLS[ERDINFO] | IR    | V/V                          | EAX[6]                   | This leaf function returns type and status information about an EPC page. |

### Instruction Operand Encoding

| Op/En | EAX          | RBX                                | RCX                                      |
|-------|--------------|------------------------------------|--|
| IR    | ERDINFO (In) | Address of a RDINFO structure (In) | Address of the destination EPC page (In) |

### Description

This instruction reads type and status information about an EPC page and returns it in a RDINFO structure. The STATUS field of the structure describes the status of the page and determines the validity of the remaining fields. The FLAGS field returns the EPCM permissions of the page; the page type; and the BLOCKED, PENDING, MODIFIED, and PR status of the page. For enclave pages, the ENCLAVECONTEXT field of the structure returns the value of SECS.ENCLAVECONTEXT. For non-enclave pages (e.g., VA) ENCLAVECONTEXT returns 0.

For invalid or non-EPC pages, the instruction returns an information code indicating the page's status, in addition to populating the STATUS field.

ERDINFO returns an error code if the destination EPC page is being modified by a concurrent SGX instruction.

RBX contains the effective address of a RDINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of ERDINFO leaf function.

### ERDINFO Memory Parameter Semantics

| RDINFO                                     | EPCPAGE                          |
|--|----------------------------------|
| Read/Write access permitted by Non Enclave | Read access permitted by Enclave |

The instruction faults if any of the following:

### ERDINFO Faulting Conditions

|  |   |
|--|---|
| A memory operand effective address is outside the DS segment limit (32b mode). | A memory operand is not properly aligned.         |
| DS segment is unusable (32b mode).   | A page fault occurs in accessing memory operands. |
| A memory address is in a non-canonical form (64b mode).                        |   |

The error codes are:

**Table 40-39. ERDINFO Return Value in RAX**

| Error Code            | Value | Description   |
|-----------------------|-------|---|
| No Error              | 0     | ERDINFO successful.   |
| SGX_EPC_PAGE_CONFLICT |       | Failure due to concurrent operation of another SGX instruction. |
| SGX_PG_INVLD          |       | Target page is not a valid EPC page.                            |
| SGX_PG_NONEPC         |       | Page is not an EPC page.  |

## Concurrency Restrictions

Instruction Operand Encoding

|       |              |  |
|-------|--------------|--|
| Op/En | EAX          | RCX                                    |
| IR    | EREMOVE (In) | Effective address of the EPC page (In) |

Description

This leaf function causes an EPC page to be un-associated with its SECS and be marked as unused. This instruction leaf can only be executed when the current privilege level is 0.

The content of RCX is an effective address of an EPC page. The DS segment is used to create linear address. Segment override is not supported.

The instruction fails if the operand is not properly aligned or does not refer to an EPC page or the page is in use by another thread, or other threads are running in the enclave to which the page belongs. In addition the instruction fails if the operand refers to an SECS with associations.

EREMOVE Memory Parameter Semantics

|                                   |
|-----------------------------------|
| EPCPAGE                           |
| Write access permitted by Enclave |

The instruction faults if any of the following:

EREMOVE Faulting Conditions

|  |   |
|--|---|
| The memory operand is not properly aligned.              | The memory operand does not resolve in an EPC page.       |
| Refers to an invalid SECS.                               | Refers to an EPC page that is locked by another thread.   |
| Another Intel SGX instruction is accessing the EPC page. | RCX does not contain an effective address of an EPC page. |
| the EPC page refers to an SECS with associations.        |   |

The error codes are:

Table 40-42. EREMOVE Return Value in RAX

| Error Code (see Table 40-4) | Description   |
|-----------------------------|---|
| No Error                    | EREMOVE successful.   |
| SGX_CHILD_PRESENT           | If the SECS still have enclave pages loaded into EPC.               |
| SGX_ENCLAVE_ACT             | If there are still logical processors executing inside the enclave. |

```

**Flags Affected**

Sets ZF if SECS is in use or invalid, otherwise cleared. Clears CF, PF, AF, OF, SF.

Protected Mode Exceptions

- #GP(0) If a memory operand effective address is outside the DS segment limit.  
If a memory operand is not properly aligned.  
If another thread is concurrently using the tracking facility on this SECS.
- #PF(error code) If a page fault occurs in accessing memory operands.  
If a memory operand is not an EPC page.

64-Bit Mode Exceptions

- #GP(0) If a memory operand is non-canonical form.  
If a memory operand is not properly aligned.  
If the specified EPC resource is in use.
- #PF(error code) If a page fault occurs in accessing memory operands.  
If a memory operand is not an EPC page.

## ETRAKCK—Activates EBLOCK Checks

| Opcode/<br>Instruction      | Op/En | 64/32<br>bit Mode<br>Support | CPUID<br>Feature<br>Flag | Description                                 |
|-----------------------------|-------|------------------------------|--------------------------|---|
| EAX = 11H<br>ENCLS[ETRAKCK] | IR    | V/V                          | EAX[6]                   | This leaf function activates EBLOCK checks. |

### Instruction Operand Encoding

| Op/En | EAX             |                         | RCX   |                                   |
|-------|-----------------|-------------------------|---|-----------------------------------|
| IR    | ETRAKCK<br>(In) | Return error code (Out) | Address of the destination EPC page<br>(In, EA) | Address of the SECS page (In, EA) |

### Description

The ETRAKCK instruction is thread safe variant of ETRACK leaf and can be executed concurrently with other CPU threads operating on the same SECS.

This leaf function provides the mechanism for hardware to track that software has completed the required TLB address clears successfully. The instruction can only be executed when the current privilege level is 0.

The content of RCX is an effective address of an EPC page.

The table below provides additional information on the memory parameter of ETRACK leaf function.

### ETRAKCK Memory Parameter Semantics

|  |
|--|
| EPCPAGE                                |
| Read/Write access permitted by Enclave |

The error codes are:

**Table 40-48. ETRAKCK Return Value in RAX**

| Error Code             | Value | Description   |
|------------------------|-------|---|
| No Error               | 0     | ETRAKCK successful.   |
| SGX_EPC_PAGE_CONFLICT  | 7     | Failure due to concurrent operation of another SGX instruction. |
| SGX_PG_INVLD           | 6     | Target page is not a VALID EPC page.                            |
| SGX_PREV_TRK_INCMPL    | 17    | All processors did not complete the previous tracking sequence. |
| SGX_TRACK_NOT_REQUIRED | 27    | Target page type does not require tracking.                     |

### Concurrency Restrictions

**Table 40-49. Base Concurrency Restrictions of ETRAKCK**

| Leaf    | Parameter       | Base Concurrency Restrictions |                       |                                    |

### Flags Affected

ZF is set if ETRACKC fails due to concurrent operations with another SGX instructions or target page is an invalid EPC page or tracking is not completed on SECS page; otherwise cleared.

CF is set if target page is not of a type that requires tracking; otherwise cleared.

PF, AF, OF and SF are cleared.

**Protected Mode Exceptions**

|                 |   |
|-----------------|---|
| #GP(0)          | If the memory operand violates access-control policies of DS segment.<br>If DS segment is unusable.<br>If the memory operand is not properly aligned. |
| #PF(error code) | If the memory operand expected to be in EPC does not resolve to an EPC page.<br>If a page fault occurs in access memory operand.                      |

## 40.4 INTEL® SGX USER LEAF FUNCTION REFERENCE

Leaf functions available with the ENCLU instruction mnemonic are covered in this section. In general, each instruction leaf requires EAX to specify the leaf function index and/or additional registers specifying leaf-specific input parameters. An instruction operand encoding table provides details of the implicitly-encoded register usage and associated input/output semantics.

In many cases, an input parameter specifies an effective address associated with a memory object inside or outside the EPC, the memory addressing semantics of these memory objects are also summarized in a separate table.

## EACCEPT—Accept Changes to an EPC Page

| Opcode/<br>Instruction      | Op/En | 64/32<br>bit Mode<br>Support | CPUID<br>Feature<br>Flag | Description   |
|-----------------------------|-------|------------------------------|--------------------------|---|
| EAX = 05H<br>ENCLU[EACCEPT] | IR    | V/V                          | SGX2                     | This leaf function accepts changes made by system software to an EPC page in the running enclave. |

### Instruction Operand Encoding

| Op/En | EAX          |                         | RBX                       | RCX                                      |
|-------|--------------|-------------------------|---------------------------|--|
| IR    | EACCEPT (In) | Return Error Code (Out) | Address of a SECINFO (In) | Address of the destination EPC page (In) |

### Description

This leaf function accepts changes to a page in the running enclave by verifying that the security attributes specified in the SECINFO match the security attributes of the page in the EPCM. This instruction leaf can only be executed when inside the enclave.

RBX contains the effective address of a SECINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of the EACCEPT leaf function.

### EACCEPT Memory Parameter Semantics

| SECINFO                              | EPCPAGE (Destination)            |
|--------------------------------------|----------------------------------|
| Read access permitted by Non Enclave | Read access permitted by Enclave |

The instruction faults if any of the following:

### EACCEPT Faulting Conditions

|  |  |
|--|--|
| The operands are not properly aligned.                                 | RBX does not contain an effective address in an EPC page in the running enclave. |
| The EPC page is locked by another thread.                              | RCX does not contain an effective address of an EPC page in the running enclave. |
| The EPC page is not valid.   | Page type is PT_REG and MODIFIED bit is 0.                                       |
| SECINFO contains an invalid request.                                   | Page type is PT_TCS or PT_TRIM and PENDING bit is 0 and MODIFIED bit is 1.       |
| If security attributes of the SECINFO page make the page inaccessible. |  |

The error codes are:

**Table 40-54. EACCEPT Return Value in RAX**

| Error Code (see Table 40-4)  | Description   |
|------------------------------|---|
| No Error                     | EACCEPT successful.   |
| SGX_PAGE_ATTRIBUTES_MISMATCH | The attributes of the target EPC page do not match the expected values. |
| SGX_NOT_TRACKED              | The OS did not complete an ETRACK on the target page.                   |

## Concurrency Restrictions

Table 40-55. Base Concurrency Restrictions of EACCEPT

| Leaf    | Parameter        | Base Concurrency Restrictions |             |                                    |
|---------|------------------|-------------------------------|-------------|------------------------------------|
|         |                  | Access                        | On Conflict | SGX_CONFLICT VM Exit Qualification |

| IR    | EACCEPTCOPY (In) | Return Error Code (Out) | Address of a SECINFO (In) | Address of the destination EPC page (In) | Address of the source EPC page (In) |

### Description

This leaf function copies the contents of an existing EPC page into an uninitialized EPC page (created by EAUG). After initialization, the instruction may also modify the access rights associated with the destination EPC page. This instruction leaf can only be executed when inside the enclave.

RBX contains the effective address of a SECINFO structure while RCX and RDX each contain the effective address of an EPC page. The table below provides additional information on the memory parameter of the EACCEPTCOPY leaf function.

### EACCEPTCOPY Memory Parameter Semantics

| SECINFO                              | EPCPAGE (Destination)                  | EPCPAGE (Source)                 |
|--------------------------------------|--|----------------------------------|
| Read access permitted by Non Enclave | Read/Write access permitted by Enclave | Read access permitted by Enclave |

The instruction faults if any of the following:

### EACCEPTCOPY Faulting Conditions

|   |  |
|---|--|
| The operands are not properly aligned.    | If security attributes of the SECINFO page make the page inaccessible.               |
| The EPC page is locked by another thread. | If security attributes of the source EPC page make the page inaccessible.            |
| The EPC page is not valid.                | RBX does not contain an effective address in an EPC page in the running enclave.     |
| SECINFO contains an invalid request.      | RCX/RDX does not contain an effective address of an EPC page in the running enclave. |

The error codes are:

**Table 40-57. EACCEPTCOPY Return Value in RAX**

| Error Code (see Table 40-4)  | Description   |
|------------------------------|---|
| No Error                     | EACCEPTCOPY successful.   |
| SGX_PAGE_ATTRIBUTES_MISMATCH | The attributes of the target EPC page do not match the expected values. |

## Concurrency Restrictions

|-------|-------------|------------------------------|-----------------------|---------------------|---|
| IR    | EENTER (In) | Content of RBX.CSSA<br>(Out) | Address of a TCS (In) | Address of AEP (In) | Address of IP following<br>EENTER (Out) |

### Description

The ENCLU[EENTER] instruction transfers execution to an enclave. At the end of the instruction, the logical processor is executing in enclave mode at the RIP computed as EnclaveBase + TCS.OENTRY. If the target address is not within the CS segment (32-bit) or is not canonical (64-bit), a #GP(0) results.

### EENTER Memory Parameter Semantics

|                |
|----------------|
| TCS            |
| Enclave access |

EENTER is a serializing instruction. The instruction faults if any of the following occurs:

|  |   |
|--|---|
| Address in RBX is not properly aligned.                    | Any TCS.FLAGS's must-be-zero bit is not zero.   |
| TCS pointed to by RBX is not valid or available or locked. | Current 32/64 mode does not match the enclave mode in SECS.ATTRIBUTES.MODE64.         |
| The SECS is in use.  | Either of TCS-specified FS and GS segment is not a subsets of the current DS segment. |
| Any one of DS, ES, CS, SS is not zero.                     | If XSAVE available, CR4.OSXSAVE = 0, but SECS.ATTRIBUTES.XFRM ≠ 3.                    |
| CR4.OSFXSR ≠ 1.  | If CR4.OSXSAVE = 1, SECS.ATTRIBUTES.XFRM is not a subset of XCR0.                     |

The following operations are performed by EENTER:

- RSP and RBP are saved in the current SSA frame on EENTER and are automatically restored on EEXIT or interrupt.
- The AEP contained in RCX is stored into the TCS for use by AEXs. FS and GS (including hidden portions) are saved and new values are constructed using TCS.OFSBASE/GSBASE (32 and 64-bit mode) and TCS.OFSLIMIT/GSLIMIT (32-bit mode only). The resulting segments must be a subset of the DS segment.
- If CR4.OSXSAVE == 1, XCR0 is saved and replaced by SECS.ATTRIBUTES.XFRM. The effect of RFLAGS.TF depends on whether the enclave entry is opt-in or opt-out (see Section 42.1.2):
  - On opt-out entry, TF is saved and cleared (it is restored on EEXIT or AEX). Any attempt to set TF via a POPF instruction while inside the enclave clears TF (see Section 42.2.5).
  - On opt-in entry, a single-step debug exception is pending on the instruction boundary immediately after EENTER (see Section 42.2.2).
- All code breakpoints that do not overlap with ELRANGE are also suppressed. If the entry is an opt-out entry, all code and data breakpoints that overlap with the ELRANGE are suppressed.
- On opt-out entry, a number of performance monitoring counters and behaviors are modified or suppressed (see Section 42.2.3):

- All performance monitoring activity on the current thread is suppressed except for incrementing and firing of FIXED\_CTR1 and FIXED\_CTR2.
- PEBS is suppressed.
- AnyThread counting on other threads is demoted to MyThread mode and IA32\_PERF\_GLOBAL\_STATUS[60] on that thread is set
- If the opt-out entry on a hardware thread results in suppression of any performance monitoring, then the processor sets IA32\_PERF\_GLOBAL\_STATUS[60] and IA32\_PERF\_GLOBAL\_STATUS[63].

## Concurrency Restrictions

**Table 40-60. Base Concurrency Restrictions of EENTER**

| Leaf   | Parameter    | Base Concurrency Restrictions |             |                                    |
|--------|--------------|-------------------------------|-------------|------------------------------------|

## EEXIT—Exits an Enclave

| Opcode/<br>Instruction    | Op/En | 64/32<br>bit Mode<br>Support | CPUID<br>Feature<br>Flag | Description                                    |
|---------------------------|-------|------------------------------|--------------------------|--|
| EAX = 04H<br>ENCLU[EEXIT] | IR    | V/V                          | SGX1                     | This leaf function is used to exit an enclave. |

### Instruction Operand Encoding

| Op/En | EAX        | RBX                                     | RCX                             |
|-------|------------|---|---------------------------------|
| IR    | EEXIT (In) | Target address outside the enclave (In) | Address of the current AEP (In) |

### Description

The ENCLU[EEXIT] instruction exits the currently executing enclave and branches to the location specified in RBX. RCX receives the current AEP. If RBX is not within the CS (32-bit mode) or is not canonical (64-bit mode) a #GP(0) results.

### EEXIT Memory Parameter Semantics

| Target Address                      |
|-------------------------------------|
| Non-Enclave read and execute access |

If RBX specifies an address that is inside the enclave, the instruction will complete normally. The fetch of the next instruction will occur in non-enclave mode, but will attempt to fetch from inside the enclave. This has the effect of abort page semantics on the next destination.

If secrets are contained in any registers, it is responsibility of enclave software to clear those registers.

If XCR0 was modified on enclave entry, it is restored to the value it had at the time of the most recent EENTER or ERESUME.

If the enclave is opt-out, RFLAGS.TF is loaded from the value previously saved on EENTER.

Code and data breakpoints are unsuppressed.

Performance monitoring counters are unsuppressed.

### Concurrency Restrictions

**Table 40-62. Base Concurrency Restrictions of EEXIT**

| Leaf  | Parameter | Base Concurrency Restrictions |             |                                    |
|-------|-----------|-------------------------------|-------------|------------------------------------|
|       |           | Access                        | On Conflict | SGX_CONFLICT VM Exit Qualification |
| EEXIT |           | Concurrent                    |             |                                    |

**Table 40-63. Additional Concurrency Restrictions of EEXIT**

| Leaf  | Parameter | Additional Concurrency Restrictions             |             |                          |             |                     |             |
|-------|-----------|---|-------------|--------------------------|-------------|---------------------|-------------|
|       |           | vs. EACCEPT, EACCEPTCOPY, EMODPE, EMODPR, EMODT |             | vs. EADD, EEXTEND, EINIT |             | vs. ETRACK, ETRACKC |             |
|       |           | Access  | On Conflict | Access                   | On Conflict | Access              | On Conflict |
| EEXIT |           | Concurrent                                      |             | Concurrent               |             | Concurrent          |             |

### Instruction Operand Encoding

| Op/En | EAX          | RBX                          | RCX                            |
|-------|--------------|------------------------------|--------------------------------|
| IR    | EGETKEY (In) | Address to a KEYREQUEST (In) | Address of the OUTPUTDATA (In) |

### Description

The ENCLU[EGETKEY] instruction returns a 128-bit secret key from the processor specific key hierarchy. The register RBX contains the effective address of a KEYREQUEST structure, which the instruction interprets to determine the key being requested. The Requesting Keys section below provides a description of the keys that can be requested. The RCX register contains the effective address where the key will be returned. Both the addresses in RBX & RCX should be locations inside the enclave.

EGETKEY derives keys using a processor unique value to create a specific key based on a number of possible inputs. This instruction leaf can only be executed inside an enclave.

### EEGETKEY Memory Parameter Semantics

| KEYREQUEST          | OUTPUTDATA           |
|---------------------|----------------------|
| Enclave read access | Enclave write access |

After validating the operands, the instruction determines which key is to be produced and performs the following actions:

- The instruction assembles the derivation data for the key based on the Table 40-64.
- Computes derived key using the derivation data and package specific value.
- Outputs the calculated key to the address in RCX.

The instruction fails with #GP(0) if the operands are not properly aligned. Successful completion of the instruction will clear RFLAGS.{ZF, CF, AF, OF, SF, PF}. The instruction returns an error code if the user tries to request a key based on an invalid CPUSVN or ISVSVN (when the user request is accepted, see the table below), requests a key for which it has not been granted the attribute to request, or requests a key that is not supported by the hardware. These checks may be performed in any order. Thus, an indication by error number of one cause (for example, invalid attribute) does not imply that there are not also other errors. Different processors may thus give different error numbers for the same Enclave. The correctness of software should not rely on the order resulting from the checks documented in this section. In such cases the ZF flag is set and the corresponding error bit (SGX\_INVALID\_SVN, SGX\_INVALID\_ATTRIBUTE, SGX\_INVALID\_KEYNAME) is set in RAX and the data at the address specified by RCX is unmodified.

### Requesting Keys

The KEYREQUEST structure (see Section 37.17.1) identifies the key to be provided. The Keyrequest.KeyName field identifies which type of key is requested.

### Deriving Keys

Key derivation is based on a combination of the enclave specific values (see Table 40-64) and a processor key. Depending on the key being requested a field may either be included by definition or the value may be included from the KeyRequest. A “yes” in Table 40-64 indicates the value for the field is included from its default location, identified in the source row, and a “request” indicates the values for the field is included from its corresponding KeyRequest field.

Table 40-64. Key Derivation

|                   | Key Name               | Attributes   | Owner Epoch        | CPU SVN                                | ISV SVN                            | ISV PRODID  | ISVEXT PRODID       | ISVFAM ILYID       | MRENCLAVE       | MRSIGNER       | CONFIG ID      | CONFIGS VN      | RAND       |

| Seal              | Yes                    | Request  | Yes                | Request                                | Request                            | Request     | Request             | Request            | Request         | Request        | Request        | Request         | Request    |
| Provisioning      | Yes                    | Request  | No                 | Request                                | Request                            | Yes         | No                  | No                 | No              | Yes            | No             | No              | Yes        |
| Provisioning Seal | Yes                    | Request  | No                 | Request                                | Request                            | Request     | Request             | Request            | No              | Yes            | Request        | Request         | Yes        |

Keys that permit the specification of a CPU or ISV's code's, or enclave configuration's SVNs have additional requirements. The caller may not request a key for an SVN beyond the current CPU, ISV or enclave configuration's SVN, respectively.

Several keys are access controlled. Access to the Provisioning Key and Provisioning Seal key requires the enclave's ATTRIBUTES.PROVISIONKEY be set. The EINITTOKEN Key requires ATTRIBUTES.EINITTOKEN\_KEY be set and SECS.MRSIGNER equal IA32\_SGXLEPUBKEYHASH.

Some keys are derived based on a hardcoded PKCS padding constant (352 byte string):

$\text{HARDCODED\_PKCS1\_5\_PADDING}[15:0] \leftarrow 0100\text{H};$

$\text{HARDCODED\_PKCS1\_5\_PADDING}[2655:16] \leftarrow \text{SignExtend330Byte}(-1);$  // 330 bytes of 0FFH

$\text{HARDCODED\_PKCS1\_5\_PADDING}[2815:2656] \leftarrow 2004000501020403650148866009060D30313000\text{H};$

The error codes are:

Table 40-65. EGETKEY Return Value in RAX

| Error Code (see Table 40-4) | Value | Description   |
|-----------------------------|-------|---|
| No Error                    | 0     | EGETKEY successful.   |
| SGX_INVALID_ATTRIBUTE       |       | The KEYREQUEST contains a KEYNAME for which the enclave is not authorized.                        |
| SGX_INVALID_CPUSVN          |       | If KEYREQUEST.CPUSVN is an unsupported platforms CPUSVN value.                                    |
| SGX_INVALID_ISVSVN          |       | If KEYREQUEST software SVN (ISVSVN or CONFIGSVN) is greater than the enclave's corresponding SVN. |
| SGX_INVALID_KEYNAME         |       | If KEYREQUEST.KEYNAME is an unsupported value.  |

## Concurrency Restrictions

Table 40-66. Base Concurrency Restrictions of EGETKEY

| Leaf    | Parameter           | Base Concurrency Restrictions |             |                                    |
|---------|---------------------|-------------------------------|-------------|------------------------------------|
|         |                     | Access                        | On Conflict | SGX_CONFLICT VM Exit Qualification |

### Flags Affected

ZF is cleared if successful, otherwise ZF is set. CF, PF, AF, OF, SF are cleared.

### Protected Mode Exceptions

|                 |   |
|-----------------|---|
| #GP(0)          | If a memory operand effective address is outside the current enclave.<br>If an effective address is not properly aligned.<br>If an effective address is outside the DS segment limit.<br>If KEYREQUEST format is invalid. |
| #PF(error code) | If a page fault occurs in accessing memory.   |

### 64-Bit Mode Exceptions

|                 |  |
|-----------------|--|
| #GP(0)          | If a memory operand effective address is outside the current enclave.<br>If an effective address is not properly aligned.<br>If an effective address is not canonical.<br>If KEYREQUEST format is invalid. |
| #PF(error code) | If a page fault occurs in accessing memory operands.   |

## EMODPE—Extend an EPC Page Permissions

| Opcode/<br>Instruction     | Op/En | 64/32<br>bit Mode<br>Support | CPUID<br>Feature<br>Flag | Description   |
|----------------------------|-------|------------------------------|--------------------------|---|
| EAX = 06H<br>ENCLU[EMODPE] | IR    | V/V                          | SGX2                     | This leaf function extends the access rights of an existing EPC page. |

### Instruction Operand Encoding

| Op/En | EAX         | RBX                       | RCX                                      |
|-------|-------------|---------------------------|--|
| IR    | EMODPE (In) | Address of a SECINFO (In) | Address of the destination EPC page (In) |

### Description

This leaf function extends the access rights associated with an existing EPC page in the running enclave. THE RWX bits of the SECINFO parameter are treated as a permissions mask; supplying a value that does not extend the page permissions will have no effect. This instruction leaf can only be executed when inside the enclave.

RBX contains the effective address of a SECINFO structure while RCX contains the effective address of an EPC page. The table below provides additional information on the memory parameter of the EMODPE leaf function.

### EMODPE Memory Parameter Semantics

| SECINFO                              | EPCPAGE                          |
|--------------------------------------|----------------------------------|
| Read access permitted by Non Enclave | Read access permitted by Enclave |

The instruction faults if any of the following:

### EMODPE Faulting Conditions

|   |  |
|---|--|
| The operands are not properly aligned.    | If security attributes of the SECINFO page make the page inaccessible.           |
| The EPC page is locked by another thread. | RBX does not contain an effective address in an EPC page in the running enclave. |
| The EPC page is not valid.                | RCX does not contain an effective address of an EPC page in the running enclave. |
| SECINFO contains an invalid request.      |  |

### Concurrency Restrictions

**Table 40-68. Base Concurrency Restrictions of EMODPE**

| Leaf   | Parameter        | Base Concurrency Restrictions |             |                                    |
|--------|------------------|-------------------------------|-------------|------------------------------------|
|        |                  | Access                        | On Conflict | SGX_CONFLICT VM Exit Qualification |
| EMODPE | Target [DS:RCX]  | Concurrent                    |             |                                    |
|        | SECINFO [DS:RBX] | Concurrent                    |             |                                    |

**Table 40-69. Additional Concurrency Restrictions of EMODPE**

| Leaf   | Parameter        | Additional Concurrency Restrictions             |             |                          |             |                     |             |
|--------|------------------|---|-------------|--------------------------|-------------|---------------------|-------------|
|        |                  | vs. EACCEPT, EACCEPTCOPY, EMODPE, EMODPR, EMODT |             | vs. EADD, EEXTEND, EINIT |             | vs. ETRACK, ETRACKC |             |
|        |                  | Access  | On Conflict | Access                   | On Conflict | Access              | On Conflict |
| EMODPE | Target [DS:RCX]  | Exclusive                                       | #GP         | Concurrent               |             | Concurrent          |             |

## EReport—Create a Cryptographic Report of the Enclave

| Opcode/<br>Instruction      | Op/En | 64/32<br>bit Mode<br>Support | CPUID<br>Feature<br>Flag | Description   |
|-----------------------------|-------|------------------------------|--------------------------|---|
| EAX = 00H<br>ENCLU[EReport] | IR    | V/V                          | SGX1                     | This leaf function creates a cryptographic report of the enclave. |

### Instruction Operand Encoding

| Op/En | EAX          | RBX                        | RCX                        | RDX  |
|-------|--------------|----------------------------|----------------------------|--|
| IR    | EReport (In) | Address of TARGETINFO (In) | Address of REPORTDATA (In) | Address where the REPORT is written to in an OUTPUTDATA (In) |

### Description

This leaf function creates a cryptographic REPORT that describes the contents of the enclave. This instruction leaf can only be executed when inside the enclave. The cryptographic report can be used by other enclaves to determine that the enclave is running on the same platform.

RBX contains the effective address of the MRENCLAVE value of the enclave that will authenticate the REPORT output, using the REPORT key delivered by EGETKEY command for that enclave. RCX contains the effective address of a 64-byte REPORTDATA structure, which allows the caller of the instruction to associate data with the enclave from which the instruction is called. RDX contains the address where the REPORT will be output by the instruction.

### EReport Memory Parameter Semantics

| TARGETINFO             | REPORTDATA             | OUTPUTDATA                   |
|------------------------|------------------------|------------------------------|
| Read access by Enclave | Read access by Enclave | Read/Write access by Enclave |

This instruction leaf perform the following:

1. Validate the 3 operands (RBX, RCX, RDX) are inside the enclave.
2. Compute a report key for the target enclave, as indicated by the value located in RBX(TARGETINFO).
3. Assemble the enclave SECS data to complete the REPORT structure (including the data provided using the RCX (REPORTDATA) operand).
4. Computes a cryptographic hash over REPORT structure.
5. Add the computed hash to the REPORT structure.
6. Output the completed REPORT structure to the address in RDX (OUTPUTDATA).

The instruction fails if the operands are not properly aligned.

CR\_REPORT\_KEYID, used to provide key wearout protection, is populated with a statistically unique value on boot of the platform by a trusted entity within the SGX TCB.

The instruction faults if any of the following:

### EReport Faulting Conditions

|  |  |
|--|--|
| An effective address not properly aligned. | An memory address does not resolve in an EPC page. |
| If accessing an invalid EPC page.          | If the EPC page is blocked.                        |
| May page fault.                            |  |

## Concurrency Restrictions

**Instruction Operand Encoding**

| Op/En | RAX          | RBX                   | RCX                 |
|-------|--------------|-----------------------|---------------------|
| IR    | ERESUME (In) | Address of a TCS (In) | Address of AEP (In) |

**Description**

The ENCLU[ERESUME] instruction resumes execution of an enclave that was interrupted due to an exception or interrupt, using the machine state previously stored in the SSA.

**ERESUME Memory Parameter Semantics**

| TCS                       |
|---------------------------|
| Enclave read/write access |

The instruction faults if any of the following:

|  |   |
|--|---|
| Address in RBX is not properly aligned.                    | Any TCS.FLAGS's must-be-zero bit is not zero.   |
| TCS pointed to by RBX is not valid or available or locked. | Current 32/64 mode does not match the enclave mode in SECS.ATTRIBUTES.MODE64.                   |
| The SECS is in use by another enclave.                     | Either of TCS-specified FS and GS segment is not a subset of the current DS segment.            |
| Any one of DS, ES, CS, SS is not zero.                     | If XSAVE available, CR4.OSXSAVE = 0, but SECS.ATTRIBUTES.XFRM ≠ 3.                              |
| CR4.OSFXSR ≠ 1.  | If CR4.OSXSAVE = 1, SECS.ATTRIBUTES.XFRM is not a subset of XCR0.                               |
| Offsets 520-535 of the XSAVE area not 0.                   | The bit vector stored at offset 512 of the XSAVE area must be a subset of SECS.ATTRIBUTES.XFRM. |
| The SSA frame is not valid or in use.                      |   |

The following operations are performed by ERESUME:

- RSP and RBP are saved in the current SSA frame on EENTER and are automatically restored on EEXIT or an asynchronous exit due to any Interrupt event.
- The AEP contained in RCX is stored into the TCS for use by AEXs. FS and GS (including hidden portions) are saved and new values are constructed using TCS.OFSBASE/GSBASE (32 and 64-bit mode) and TCS.OFSLIMIT/GSLIMIT (32-bit mode only). The resulting segments must be a subset of the DS segment.
- If CR4.OSXSAVE == 1, XCR0 is saved and replaced by SECS.ATTRIBUTES.XFRM. The effect of RFLAGS.TF depends on whether the enclave entry is opt-in or opt-out (see Section 42.1.2):
  - On opt-out entry, TF is saved and cleared (it is restored on EEXIT or AEX). Any attempt to set TF via a POPF instruction while inside the enclave clears TF (see Section 42.2.5).
  - On opt-in entry, a single-step debug exception is pending on the instruction boundary immediately after EENTER (see Section 42.2.3).
- All code breakpoints that do not overlap with ELRANGE are also suppressed. If the entry is an opt-out entry, all code and data breakpoints that overlap with the ELRANGE are suppressed.

- On opt-out entry, a number of performance monitoring counters and behaviors are modified or suppressed (see Section 42.2.3):
  - All performance monitoring activity on the current thread is suppressed except for incrementing and firing of FIXED\_CTR1 and FIXED\_CTR2.
  - PEBS is suppressed.
  - AnyThread counting on other threads is demoted to MyThread mode and IA32\_PERF\_GLOBAL\_STATUS[60] on that thread is set.
  - If the opt-out entry on a hardware thread results in suppression of any performance monitoring, then the processor sets IA32\_PERF\_GLOBAL\_STATUS[60] and IA32\_PERF\_GLOBAL\_STATUS[63].

## 40.5 INTEL® SGX VIRTUALIZATION LEAF FUNCTION REFERENCE

Leaf functions available with the ENCLV instruction mnemonic are covered in this section. In general, each instruction leaf requires EAX to specify the leaf function index and/or additional implicit registers specifying leaf-specific input parameters. An instruction operand encoding table provides details of each implicit register usage and associated input/output semantics.

In many cases, an input parameter specifies an effective address associated with a memory object inside or outside the EPC, the memory addressing semantics of these memory objects are also summarized in a separate table.

**EDECVIRTCHILD—Decrement VIRTCHILDCNT in SECS**

| Opcode/<br>Instruction            | Op/En | 64/32<br>bit Mode<br>Support | CPUID<br>Feature<br>Flag | Description  |
|-----------------------------------|-------|------------------------------|--------------------------|--|
| EAX = 00H<br>ENCLV[EDECVIRTCHILD] | IR    | V/V                          | EAX[5]                   | This leaf function decrements the SECS VIRTCHILDCNT field. |

**Instruction Operand Encoding**

| Op/En | EAX                | RBX                             | RCX                          |
|-------|--------------------|---------------------------------|------------------------------|
| IR    | EDECVIRTCHILD (In) | Address of an enclave page (In) | Address of an SECS page (In) |

**Description**

This instruction decrements the SECS VIRTCHILDCNT field. This instruction can only be executed when current privilege level is 0.

The content of RCX is an effective address of an EPC page. The DS segment is used to create linear address. Segment override is not supported.

**EDECVIRTCHILD Memory Parameter Semantics**

| EPCPAGE                                    | SECS                             |
|--|----------------------------------|
| Read/Write access permitted by Non Enclave | Read access permitted by Enclave |

The instruction faults if any of the following:

**EDECVIRTCHILD Faulting Conditions**

|  |   |
|--|---|
| A memory operand effective address is outside the DS segment limit (32b mode). | A page fault occurs in accessing memory operands.                             |
| DS segment is unusable (32b mode).   | RBX does not refer to an enclave page (REG, TCS, TRIM, SECS).                 |
| A memory address is in a non-canonical form (64b mode).                        | RCX does not refer to an SECS page.   |
| A memory operand is not properly aligned.                                      | RBX does not refer to an enclave page associated with SECS referenced in RCX. |

| EAX = 01H<br>ENCLV[EINCVIRTCHILD] | IR    | V/V                          | EAX[5]                   | This leaf function increments the SECS VIRTCHILDCNT field. |

### Instruction Operand Encoding

| Op/En | EAX                | RBX                             | RCX                          |
|-------|--------------------|---------------------------------|------------------------------|
| IR    | EINCVIRTCHILD (In) | Address of an enclave page (In) | Address of an SECS page (In) |

### Description

This instruction increments the SECS VIRTCHILDCNT field. This instruction can only be executed when the current privilege level is 0.

The content of RCX is an effective address of an EPC page. The DS segment is used to create a linear address. Segment override is not supported.

### EINCVIRTCHILD Memory Parameter Semantics

| EPCPAGE                                    | SECS                             |
|--|----------------------------------|
| Read/Write access permitted by Non Enclave | Read access permitted by Enclave |

The instruction faults if any of the following:

### EINCVIRTCHILD Faulting Conditions

|  |   |
|--|---|
| A memory operand effective address is outside the DS segment limit (32b mode). | A page fault occurs in accessing memory operands.                             |
| DS segment is unusable (32b mode).   | RBX does not refer to an enclave page (REG, TCS, TRIM, SECS).                 |
| A memory address is in a non-canonical form (64b mode).                        | RCX does not refer to an SECS page.   |
| A memory operand is not properly aligned.                                      | RBX does not refer to an enclave page associated with SECS referenced in RCX. |

### Concurrency Restrictions

**Table 40-76. Base Concurrency Restrictions of EINCVIRTCHILD**

| Leaf          | Parameter       | Base Concurrency Restrictions |                       |                                    |
|---------------|-----------------|-------------------------------|-----------------------|------------------------------------|
|               |                 | Access                        | On Conflict           | SGX_CONFLICT VM Exit Qualification |
| EINCVIRTCHILD | Target [DS:RBX] | Shared                        | SGX_EPC_PAGE_CONFLICT |                                    |
|               | SECS [DS:RCX]   | Concurrent                    |                       |                                    |

**Table 40-77. Additional Concurrency Restrictions of EINCVIRTCHILD**

| Leaf          | Parameter       | Additional Concurrency Restrictions             |             |                          |             |                     |             |
|---------------|-----------------|---|-------------|--------------------------|-------------|---------------------|-------------|
|               |                 | vs. EACCEPT, EACCEPTCOPY, EMODPE, EMODPR, EMODT |             | vs. EADD, EEXTEND, EINIT |             | vs. ETRACK, ETRACKC |             |
|               |                 | Access  | On Conflict | Access                   | On Conflict | Access              | On Conflict |
| EINCVIRTCHILD | Target [DS:RBX] | Concurrent                                      |             | Concurrent               |             | Concurrent          |             |
|               | SECS [DS:RCX]   | Concurrent                                      |             | Concurrent               |             | Concurrent          |             |

|                 | If RCX does not refer to an SECS page.  |

## ESETCONTEXT—Set the ENCLAVECONTEXT Field in SECS

| Opcode/<br>Instruction          | Op/En | 64/32<br>bit Mode<br>Support | CPUID<br>Feature<br>Flag | Description   |
|---------------------------------|-------|------------------------------|--------------------------|---|
| EAX = 02H<br>ENCLV[ESETCONTEXT] | IR    | V/V                          | EAX[5]                   | This leaf function sets the ENCLAVECONTEXT field in SECS. |

### Instruction Operand Encoding

| Op/En | EAX              | RCX   | RDX                    |
|-------|------------------|---|------------------------|
| IR    | ESETCONTEXT (In) | Address of the destination EPC page<br>(In, EA) | Context Value (In, EA) |

### Description

The ESETCONTEXT leaf overwrites the ENCLAVECONTEXT field in the SECS. ECREATE and ELD of an SECS set the ENCLAVECONTEXT field in the SECS to the address of the SECS (for access later in ERDINFO). The ESETCONTEXT instruction allows a VMM to overwrite the default context value if necessary, for example, if the VMM is emulating ECREATE or ELD on behalf of the guest.

The content of RCX is an effective address of the SECS page to be updated, RDX contains the address pointing to the value to be stored in the SECS. The DS segment is used to create linear address. Segment override is not supported.

The instruction fails if:

- The operand is not properly aligned.
- RCX does not refer to an SECS page.

### ESETCONTEXT Memory Parameter Semantics

| EPCPAGE                          | CONTEXT                                    |
|----------------------------------|--|
| Read access permitted by Enclave | Read/Write access permitted by Non Enclave |

The instruction faults if any of the following:

### ESETCONTEXT Faulting Conditions

|  |   |
|--|---|
| A memory operand effective address is outside the DS segment limit (32b mode). | A memory operand is not properly aligned.         |
| DS segment is unusable (32b mode).   | A page fault occurs in accessing memory operands. |
| A memory address is in a non-canonical form (64b mode).                        |   |

## 27. Updates to Chapter 41, Volume 3D

Change bars show changes to Chapter 41 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D: System Programming Guide, Part 4*.

-----  
Changes to this chapter: Various updates throughout chapter regarding Intel SGX and new Intel SGX VM Over-subscription feature.

# CHAPTER 41

## INTEL® SGX INTERACTIONS WITH IA32 AND INTEL® 64 ARCHITECTURE

---

Intel® SGX provides Intel® Architecture with a collection of enclave instructions for creating protected execution environments on processors supporting IA32 and Intel® 64 architectures. These Intel SGX instructions are designed to work with legacy software and the various IA32 and Intel 64 modes of operation.

### 41.1 INTEL® SGX AVAILABILITY IN VARIOUS PROCESSOR MODES

The Intel SGX extensions (see Table 36-1) are available only when the processor is executing in protected mode of operation. Additionally, the extensions are not available in System Management Mode (SMM) of operation or in Virtual 8086 (VM86) mode of operation. Finally, all leaf functions of ENCLU and ENCLS require CR0.PG enabled.

The exact details of exceptions resulting from illegal modes and their priority are listed in the reference pages of ENCLS and ENCLU.

### 41.2 IA32\_FEATURE\_CONTROL

IA32\_FEATURE\_CONTROL MSR provides two new bits related to two aspects of Intel SGX: using the instruction extensions and launch control configuration.

#### 41.2.1 Availability of Intel SGX

IA32\_FEATURE\_CONTROL[bit 18] allows BIOS to control the availability of Intel SGX extensions. For Intel SGX extensions to be available on a logical processor, bit 18 in the IA32\_FEATURE\_CONTROL MSR on that logical processor must be set, and IA32\_FEATURE\_CONTROL MSR on that logical processor must be locked (bit 0 must be set). See Section 36.7.1 for additional details. OS is expected to examine the value of bit 18 prior to enabling Intel SGX on the thread, as the settings of bit 18 is not reflected by CPUID.

#### 41.2.2 Intel SGX Launch Control Configuration

The IA32\_SGXLEPUBKEYHASHn MSRs used to configure authorized launch enclaves' MRSIGNER digest value. They are present on logical processors that support the collection of SGX1 leaf functions (i.e. CPUID.(EAX=12H, ECX=00H):EAX[0] = 1) and that CPUID.(EAX=07H, ECX=00H):ECX[30] = 1. IA32\_FEATURE\_CONTROL[bit 17] allows to BIOS to enable write access to these MSRs. If IA32\_FEATURE\_CONTROL.LE\_WR (bit 17) is set to 1 and IA32\_FEATURE\_CONTROL is locked on that logical processor, IA32\_SGXLEPUBKEYHASH MSRs on that logical processor are writeable. If this bit 17 is not set or IA32\_FEATURE\_CONTROL is not locked, IA32\_SGXLEPUBKEYHASH MSRs are read only. See Section 38.1.4 for additional details.

### 41.3 INTERACTIONS WITH SEGMENTATION

#### 41.3.1 Scope of Interaction

Intel SGX extensions are available only when the processor is executing in a protected mode operation (see Section 41.1 for Intel SGX availability in various processor modes). Enclaves abide by all the segmentation policies set up by the OS, but they can be more restrictive than the OS.

Intel SGX interacts with segmentation at two levels:

- The Intel SGX instruction (see the enclave instruction in Table 36-1).

- While executing inside an enclave (legacy instructions and enclave instructions permitted inside an enclave).

### 41.3.2 Interactions of Intel® SGX Instructions with Segment, Operand, and Addressing Prefixes

All the memory operands used by the Intel SGX instructions are interpreted as offsets within the data segment (DS). The segment-override prefix on Intel SGX instructions is ignored.

Operand size is fixed for each enclave instruction. The operand-size prefix is reserved, and results in a #UD exception if used.

All address sizes are determined by the operating mode of the processor. The address-size prefix is ignored. This implies that while operating in 64-bit mode of operation, the address size is always 64 bits, and while operating in 32-bit mode of operation, the address size is always 32 bits. Additionally, when operating in 16-bit addressing, memory operands used by enclave instructions use 32 bit addressing; the value of CS.D is ignored.

### 41.3.3 Interaction of Intel® SGX Instructions with Segmentation

All leaf functions of ENCLU and ENCLS instructions require that the DS segment be usable, and be an expand-up segment. Failing this check results in generation of a #GP(0) exception.

The Intel SGX leaf functions used for entering the enclave (ENCLU[EENTER] and ENCLU[ERESUME]) operate as follows:

- All usable segment registers except for FS and GS have a zero base.
- The contents of the FS/GS segment registers (including the hidden portion) is saved in the processor.
- New FS and GS values compatible with enclave security are loaded from the TCS
- The linear ranges and access rights available under the newly-loaded FS and GS must abide to OS policies by ensuring they are subsets of the linear-address range and access rights available for the DS segment.
- The CS segment mode (64-bit, compatible, or 32 bit modes) must be consistent with the segment mode for which the enclave was created, as indicated by the SECS.ATTRIBUTES.MODE64 bit, and that the CPL of the logical processor is 3

An exit from the enclave either via ENCLU[EEXIT] or via an AEX restores the saved values of FS/GS segment registers.

### 41.3.4 Interactions of Enclave Execution with Segmentation

During the course of execution, enclave code abides by all segmentation policies as dictated by IA32 and Intel 64 Architectures, and generates appropriate exceptions on violations.

Additionally, any attempt by software executing inside an enclave to modify the processor's segmentation state (e.g. via MOV seg register, POP seg register, LDS, far jump, etc; excluding WRFSBASE/WRGSBASE) results in the generation of a #UD. See Section 38.6.1 for more information.

Upon enclave entry via the EENTER leaf function, FS is loaded from the (TCS.OFSBASE + SECS.BASEADDR) and TCS.FSLIMIT fields and GS is loaded from the (TCS.OGSBASE + SECS.BASEADDR) and TCS.GSLIMIT fields.

Execution of WRFSBASE and WRGSBASE from inside a 64-bit enclave is allowed. The processor will save the new values into the current SSA frame on an asynchronous exit (AEX) and restore them back on enclave entry via ENCLU[ERESUME] instruction.

## 41.4 INTERACTIONS WITH PAGING

Intel SGX instructions are available only when the processor is executing in a protected mode of operation. Additionally, all Intel SGX leaf functions except for EDBGD and EDBGW are available only if paging is enabled. Any attempt to execute these leaf functions with paging disabled results in an invalid-opcode exception (#UD). As with

segmentation, enclaves abide by all the paging policies set up by the OS, but they can be more restrictive than the OS.

All the memory operands passed into Intel SGX instructions are interpreted as offsets within the DS segment, and the linear addresses generated by combining these offsets with DS segment register are subject to paging-based access control if paging is enabled at the time of the execution of the leaf function.

Since the ENCLU[EENTER] and ENCLU[ERESUME] can only be executed when paging is enabled, and since paging cannot be disabled by software running inside an enclave (recall that enclaves always run with CPL = 3), enclave execution is always subject to paging-based access control. The Intel SGX access control itself is implemented as an extension to the existing paging modes. See Section 37.5 for details.

Execution of Intel SGX instructions may set accessed and dirty flags on accesses to EPC pages that do not fault even if the instruction later causes a fault for some other reason.

## 41.5 INTERACTIONS WITH VMX

Intel SGX functionality (including SGX1 and SGX2) can be made available to software running in either VMX root operation or VMX non-root operation, as long as the processor is using a legal mode of operation (see Section 41.1).

A VMM has the flexibility to configure a VMCS to permit a guest to use any subset of the ENCLS leaf functions. Availability of the ENCLU leaf functions in VMX non-root operation has the same requirement as ENCLU leaf functions outside of a virtualized environment.

Details of the VMCS control to allow VMM to configure support of Intel SGX in VMX non-root operation is described in Section 41.5.1

### 41.5.1 VMM Controls to Configure Guest Support of Intel® SGX

Intel SGX capabilities are primarily exposed to the software via the CPUID instruction. VMMs can virtualize CPUID instruction to expose/hide this capability to/from guests.

Some of Intel SGX resources are exposed/controlled via model-specific registers (see Section 36.7). VMMs can virtualize these MSRs for the guests using the MSR bitmaps referenced by pointers in the VMCS.

The VMM can partition the Enclave Page Cache, and assign various partitions to (a subset of) its guests via the usual memory-virtualization techniques such as paging or the extended page table mechanism (EPT).

The VMM can set the “enable ENCLS exiting” VM-execution controls to cause a VM exit when the ENCLS instruction is executed in VMX non-root operation. If the “enable ENCLS exiting” control is 0, all of the ENCLS leaf functions are permitted in VMX non-root operation. If the “enable ENCLS exiting” control is 1, execution of ENCLS leaf functions in VMX non-root operation is governed by consulting the bits in a new 64-bit VM-execution control field called the ENCLS-exiting bitmap (Each bit in the bitmap corresponds to an ENCLS leaf function with an EAX value that is identical to the bit’s position). When bits in the “ENCLS-exiting bitmap” are set, attempts to execute the corresponding ENCLS leaf functions in VMX non-root operation causes VM exits. The checking for these VM exits occurs immediately after checking that CPL = 0.

### 41.5.2 Interactions with the Extended Page Table Mechanism (EPT)

Intel SGX instructions are fully compatible with the extended page-table mechanism (EPT; see Section 28.2).

All the memory operands passed into Intel SGX instructions are interpreted as offsets within the DS segment, and the linear addresses generated by combining these offsets with DS segment register are subject to paging and EPT. As with paging, enclaves abide by all the policies set up by the VMM.

The Intel SGX access control itself is implemented as an extension to paging and EPT, and may be more restrictive. See Section 41.4 for details of this extension.

An execution of an Intel SGX instruction may set accessed and dirty flags for EPT (when enabled; see Section 28.2.4) on accesses to EPC pages that do not fault or cause VM exits even if the instruction later causes a fault or VM exit for some other reason.

### 41.5.3 Interactions with APIC Virtualization

This section applies to Intel SGX in VMX non-root operation when the “virtualize APIC accesses” VM-execution control is 1.

A memory access by an enclave instruction that implicitly uses a cached physical address is never checked for overlap with the APIC-access page. Such accesses never cause APIC-access VM exits and are never redirected to the virtual-APIC page. Implicit memory accesses can only be made to the SECS, the TCS, or the SSA of an enclave (see Section 37.5.3.2).

An explicit Enclave Access (a linear memory access which is either from within an enclave into its ELRANGE, or an access by an Intel SGX instruction that is expected to be in the EPC) that overlaps with the APIC-access page causes a #PF exception (APIC page is expected to be outside of EPC).

Non-Enclave accesses made either by an Intel SGX instruction or by a logical processor inside an enclave to an address that without SGX would have caused redirection to the virtual-APIC page instead cause an APIC-access VM exit.

Other than implicit accesses made by Intel SGX instructions, guest-physical and physical accesses are not considered “enclave accesses”; consequently, such accesses result in undefined behavior if these accesses eventually reach EPC. This applies to any non-enclave physical accesses.

While a logical processor is executing inside an enclave, an attempt to execute an instruction outside of ELRANGE results in a #GP(0), even if the linear address would translate to a physical address that overlaps the APIC-access page.

### 41.5.4 Interactions with VT and SGX concurrency

In some cases, a VMM is required to handle conflicts between its own operation and a guest operation on EPC pages that are present in both guest and VMM address space. These conflict would otherwise cause the guest to experience an unexpected behavior (vs. running directly on the h/w). These conflict cases are:

- ETRACK/ETRAKCK failure due to Entry Epoch Object Lock conflict or reference tracking check failure.
- EPC Page Resource conflict.

A new exit reason is defined for all those cases: SGX\_CONFLICT (value 71). The VMCS exit qualification field details the specific case as follows:

**Table 41-1. SGX Conflict Exit Qualification**

| Bits  | Size (bits) | Name     | Description   |
|-------|-------------|----------|---|
| 15:0  | 16          | Code     | Exit qualification code. The following values are defined:<br>0: TRACKING_RESOURCE_CONFLICT<br>1: TRACKING_REFERENCE_CONFLICT<br>2: EPC_PAGE_CONFLICT_EXCEPTION<br>3: EPC_PAGE_CONFLICT_ERROR<br>Other: Reserved  |
| 31:16 | 16          | Error    | Error code. Applicable only if the exit qualification code is EPC_PAGE_CONFLICT_ERROR; contains the error code that would be returned in RAX if the instruction was executed on bare metal platform or if the ENABLE_EPC_VIRTUALIZATION_EXTENSIONS bit in the secondary processor control field is not set. In other cases this field is reserved as 0. |
| 63:32 | 32          | Reserved | Always 0.   |

This SGX\_CONFLICT exiting behavior is controlled by a VM execution control called ENABLE\_EPC\_VIRTUALIZATION\_EXTENSIONS (bit 29 of the secondary processor control field).

Details for various SGX\_CONFLICT VMEXIT cases are provided in the following sections.

### 41.5.5 Virtual Child Tracking

SGX oversubscription support adds the ability to associate virtual children with each enclave using the ENCLV[EINCVIRTCHILD] and ENCLV[EDECVIRTCHILD] instructions. The VMM enables checking of the virtual child count by EREMOVE and EWB in guests with a new VM execution control called ENABLE\_EPC\_VIRTUALIZATION\_EXTENSIONS.

When in VMX non-root operation and the ENABLE\_EPC\_VIRTUALIZATION\_EXTENSIONS control enabled, the following instructions change their behavior:

- EWB and EREMOVE return the SGX\_CHILD\_PRESENT error code if any virtual or physical children are associated with the enclave.
- ERDINFO set STATUS.CHILDPRESENT if any virtual or physical children are associated with the enclave.

### 41.5.6 Handling EPCM Entry Lock Conflicts

When performing paging within a VMM, it is possible for a contention on the EPC page to happen in the following case:

- The VMM performs an ELDB/ELDU/ELDBC/ELDUC of an enclave page, and the guest attempts to perform some SGX instruction (e.g., EREMOVE) where the same SECS parent page is required.

A similar conflict may occur if the VMM uses EINCVIRTCHILD or EDECVIRTCHILD pointing to an SECS page. In all other cases where a SGX instruction executed by the VMM the applicable EPC page should not be mapped to the guest, thus no resource conflict occurs.

This conflicting situation can cause the guest's instruction to fail and cause guest instability. To help the VMM manage such conflicts, the SGX VMM paging extensions introduce a new VM-Exit that will be triggered whenever the guest encounters a resource conflict.

The exit reason is SGX\_CONFLICT. The exit qualification field is used to distinguish the two kinds of resource conflicts:

- A value of EPCM\_RESOURCE\_CONFLICT\_EXCEPTION (2) in the exit qualification code field indicates that a resource conflict occurred that would result in a #GP. In that case, the exit qualification error field is set to zero.
- A value of EPC\_PAGE\_CONFLICT\_ERROR (3) in the exit qualification code field indicates that a resource conflict occurred that would result in an error code being return in RAX. In that case, the exit qualification error field is set to SGX\_EPC\_PAGE\_CONFLICT.

The Guest Linear Address and Guest Physical Address fields are set to the guest linear and guest physical addresses respectively of the EPC page on which the conflict occurred. The VMM may determine which instruction induced the exit by reading RAX. The exit also populates the VM-exit instruction length field.

The VMM can determine whether the conflict may be due to its own operation, e.g., by setting a per-enclave busy indicator before executing ELD\*, and clearing it afterwards. In that case, the VMM can handle an SGX Conflict (EPCM\_PAGE\_CONFLICT\_\*) exit by resuming guest execution at the same instruction, allowing the guest to re-execute the instruction. The VMM may also take steps to throttle its own paging thread to reduce contention with the guest.

If the VMM determines that the conflict is not due to its own operation, it may inject a #GP (in case of EPC\_PAGE\_CONFLICT\_EXCEPTION), or emulate an error code as the guest instruction would return (in case of EPC\_PAGE\_CONFLICT\_ERROR) by setting ZF and copying the error value provided in the exit qualification to guest RAX.

To gracefully handle resource contention on the VMM side, the VMM should use the new ELDBC and ELDUC instructions. These are similar to ELDB and ELDU respectively, except that on EPC resource contention they return an SGX\_EPC\_PAGE\_CONFLICT error instead of issuing a #GP. In case of an error, the VMM can retry the instruction, possibly throttling the guest to assure progress.

When using EDECVIRTCHILD and EINCVIRTCHILD, the VMM should preferably point to the enclave child page, not to the SECS page, avoiding resource conflict on the SECS. If the VMM chooses to point to the SECS page, it should handle conflicts in the same way as handling the ELD\* case.

### 41.5.7 Context Tracking

The ENCLAVECONTEXT field in the SECS is available for use by the VMM to track context information associated with that enclave, such as the GPA of the SECS in the context of the appropriate guest. This field is initialized by the successful execution of ECREATE and ELD of an SECS page. The value stored in the ENCLAVECONTEXT field will be the translation of the target page address produced by paging (GPA in VMMs that have EPTs turned on). VMMs may override this default value by calling the ENCLV[ESETCONTEXT] instruction, which allows the VMM to store an arbitrary 64-bit value in the ENCLAVECONTEXT field. The VMM may later access the ENCLAVECONTEXT field by calling ENCLS[ERDINFO] on any member page of the enclave, including the SECS.

For nested virtualization cases, the lowest level VMM can make SGX oversubscription instructions higher level guest VMMs. In that case the lower level VMM can simply inject #GP to higher level VMMs when attempting to execute these instructions.

However, if VMMs expose SGX oversubscription instructions to higher level VMMs, then VMMs have to use ENCLV[ESETCONTEXT] instruction to properly manage the ENCLAVECONTEXT field of SECS during paging operations. That may involve emulating ECREATE, ELD, ESETCONTEXT and ERDINFO instructions apart from managing ENCLAVECONTEXT values.

## 41.6 INTEL® SGX INTERACTIONS WITH ARCHITECTURALLY-VISIBLE EVENTS

All architecturally visible vectored events (IA32 exceptions, interrupts, SMI, NMI, INIT, VM exit) can be detected while inside an enclave and will cause an asynchronous enclave exit if they are not blocked. Additionally, INT3, and the SignalTXTMsg[SENDER] (i.e. GETSEC[SENDER]'s rendezvous event message) events also cause asynchronous enclave exits. Note that SignalTXTMsg[SEXIT] (i.e. GETSEC[SEXIT]'s teardown message) does not cause an AEX.

On an AEX, information about the event causing the AEX is stored in the SSA (see Section 39.4 for details of AEX). The information stored in the SSA only describes the first event that triggered the AEX. If parsing/delivery of the first event results in detection of further events (e.g. VM exit, double fault, etc.), then the event information in the SSA is not updated to reflect these subsequently detected events.

## 41.7 INTERACTIONS WITH THE PROCESSOR EXTENDED STATE AND MISCELLANEOUS STATE

### 41.7.1 Requirements and Architecture Overview

Processor extended states are the ISA features that are enabled by the settings of CR4.OSXSAVE and the XCR0 register. Processor extended states are normally saved/restored by software via XSAVE/XRSTOR instructions. Details of discovery of processor extended states and management of these states are described in CHAPTER 13 of *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*.

Additionally, the following requirements apply to Intel SGX:

- On an AEX, the Intel SGX architecture must protect the processor extended state and miscellaneous state by saving them in the enclave's state-save area (SSA), and clear the secrets from the processor extended state that is used by an enclave.
- Intel SGX architecture must verify that the SSA frame size is large enough to contain all the processor extended states and miscellaneous state used by the enclave.
- Intel SGX architecture must ensure that enclaves can only use processor extended state that is enabled by system software in XCR0.
- Enclave software should be able to discover only those processor extended state and miscellaneous state for which such protection is enabled.
- The processor extended states that are enabled inside the enclave must be approved by the enclave developer:
  - Certain processor extended state (e.g., Memory Protection Extensions, see Chapter 17, "Intel® MPX" of *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1*) modify the behavior of the

legacy ISA software. If such features are enabled for enclaves that do not understand those features, then such a configuration could lead to a compromise of the enclave's security.

- The processor extended states that are enabled inside the enclave must form an integral part of the enclave's identity. This requirement has two implications:
  - Service providers may decide to assign different trust level to the same enclave depending on the ISA features the enclave is using.

To meet these requirements, the Intel SGX architecture defines a sub-field called X-Feature Request Mask (XFRM) in the ATTRIBUTES field of the SECS. On enclave creation (ENCLS[ECREATE] leaf function), the required SSA frame size is calculated by the processor from the list of enabled extended and miscellaneous states and verified against the actual SSA frame size defined by SECS.SSAFRAMESIZE.

On enclave entry, after verifying that XFRM is only enabling features that are already enabled in XCR0, the value in the XCR0 is saved internally by the processor, and is replaced by the XFRM. On enclave exit, the original value of XCR0 is restored. Consequently, while inside the enclave, the processor extended states enabled in XFRM are in enabled state, and those that are disabled in XFRM are in disabled state.

The entire ATTRIBUTES field, including the XFRM subfield is integral part of enclave's identity (i.e., its value is included in reports generated by ENCLU[EREPORT], and select bits from this field can be included in key-derivation for keys obtained via the ENCLU[EGETKEY] leaf function).

Enclave developers can create their enclave to work with certain features and fallback to another code path in case those features aren't available (e.g. optimize for AVX and fallback to SSE). For this purpose Intel SGX provides the following fields in SIGSTRUCT: ATTRIBUTES, ATTRIBUTESMASK, MISCSELECT, and MISCMASK. EINIT ensures that the final SECS.ATTRIBUTES and SECS.MISCSELECT comply with the enclave developer's requirements as follows:

`SIGSTRUCT.ATTRIBUTES & SIGSTRUCT.ATTRIBUTESMASK = SECS.ATTRIBUTES & SIGSTRUCT.ATTRIBUTESMASK`

`SIGSTRUCT.MISCSELECT & SIGSTRUCT.MISCMASK = SECS.MISCSELECT & SIGSTRUCT.MISCMASK`

On an asynchronous enclave exit, the processor extended states enabled by XFRM are saved in the current SSA frame, and overwritten by synthetic state (see Section 39.3 for the definition of the synthetic state). When the interrupted enclave is resumed via the ENCLU[ERESUME] leaf function, the saved state for processor extended states enabled by XFRM is restored.

## 41.7.2 Relevant Fields in Various Data Structures

### 41.7.2.1 SECS.ATTRIBUTES.XFRM

The ATTRIBUTES field of the SECS data structure (see Section 37.7) contains a sub-field called XSAVE-Feature Request Mask (XFRM). Software populates this field at the time of enclave creation according to the features that are enabled by the operating system and approved by the enclave developer.

Intel SGX architecture guarantees that during enclave execution, the processor extended state configuration of the processor is identical to what is required by the XFRM sub-field. All the processor extended states enabled in XFRM are saved on AEX from the enclave and restored on ERESUME.

The XFRM sub-field has the same layout as XCR0, and has consistency requirements that are similar to those for XCR0. Specifically, the consistency requirements on XFRM values depend on the processor implementation and the set of features enabled in CR4.

Legal values for SECS.ATTRIBUTES.XFRM conform to these requirements:

- XFRM[1:0] must be set to 0x3.
- If the processor does not support XSAVE, or if the system software has not enabled XSAVE, then XFRM[63:2] must be zero.
- If the processor does support XSAVE, XFRM must contain a value that would be legal if loaded into XCR0.

The various consistency requirements are enforced at different times in the enclave's life cycle, and the exact enforcement mechanisms are elaborated in Section 41.7.3 through Section 41.7.6.

On processors not supporting XSAVE, software should initialize XFRM to 0x3. On processors supporting XSAVE, software should initialize XFRM to be a subset of XCR0 that would be present at the time of enclave execution.

Because bits 0 and 1 of XFRM must always be set, the use of Intel SGX requires that SSE be enabled (CR4.OSFXSR = 1).

#### 41.7.2.2 SECS.SSAFRAME\_SIZE

The SSAFRAME\_SIZE field in the SECS data structure specifies the number of pages which software allocated<sup>1</sup> for each SSA frame, including both the GPRSGX area, MISC area, the XSAVE area (x87 and XMM states are stored in the latter area), and optionally padding between the MISC and XSAVE area. The GPRSGX area must hold all the general-purpose registers and additional Intel SGX specific information. The MISC area must hold the Miscellaneous state as specified by SECS.MISCSELECT, the XSAVE area holds the set of processor extended states specified by SECS.ATTRIBUTES.XFRM (see Section 37.9 for the layout of SSA and Section 41.7.3 for ECREATE's consistency checks). The SSA is always in non-compacted format.

If the processor does not support XSAVE, the XSAVE area will always be 576 bytes; a copy of XFRM (which will be set to 0x3) is saved at offset 512 on an AEX.

If the processor does support XSAVE, the length of the XSAVE area depends on SECS.ATTRIBUTES.XFRM. The length would be equal to what CPUID.(EAX=0DH, ECX= 0):EBX would return if XCR0 were set to XFRM. The following pseudo code illustrates how software can calculate this length using XFRM as the input parameter without modifying XCR0:

```
offset = 576;
size_last_x = 0;
For x=2 to 63
  IF (XFRM[x] != 0) Then
    tmp_offset = CPUID.(EAX=0DH, ECX= x):EBX[31:0];
    IF (tmp_offset >= offset + size_last_x) Then
      offset = tmp_offset;
      size_last_x = CPUID.(EAX=0DH, ECX= x):EAX[31:0];
    FI;
  FI;
EndFor
return (offset + size_last_x); (* compute_xsave_size(XFRM), see "ECREATE—Create an SECS page in the Enclave Page Cache"*)
```

Where the non-zero bits in XFRM are a subset of non-zero bit fields in XCR0.

The size of the MISC region depends on the setting of SECS.MISCSELECT and can be calculated using the layout information described in Section 37.9.2

#### 41.7.2.3 XSAVE Area in SSA

The XSAVE area of an SSA frame begins at offset 0 of the frame.

#### 41.7.2.4 MISC Area in SSA

The MISC area of an SSA frame is positioned immediately before the GPRSGX region.

#### 41.7.2.5 SIGSTRUCT Fields

Intel SGX provides the flexibility for an enclave developer to choose the enclave's code path according to the features that are enabled on the platform (e.g. optimize for AVX and fallback to SSE). See Section 41.7.1 for details.

---

1. It is the responsibility of the enclave to actually allocate this memory.

SIGSTRUCT includes the following fields:

SIGSTRUCT.ATTRIBUTES, SIGSTRUCT.ATTRIBUTEMASK, SIGSTRUCT.MISCSELECT, SIGSTRUCT.MISCMASK.

#### 41.7.2.6 REPORT.ATTRIBUTES.XFRM and REPORT.MISCSELECT

The processor extended states and miscellaneous states that are enabled inside the enclave form an integral part of the enclave's identity and are therefore included in the enclave's report, as provided by the ENCLU[EREPORT] leaf function. The REPORT structure includes the enclave's XFRM and MISCSELECT configurations.

#### 41.7.2.7 KEYREQUEST

An enclave developer can specify which bits out of XFRM and MISCSELECT ENCLU[EGETKEY] should include in the derivation of the sealing key by specifying ATTRIBUTEMASK and MISCMASK in the KEYREQUEST structure.

### 41.7.3 Processor Extended States and ENCLS[ECREATE]

The ECREATE leaf function of the ENCLS instruction enforces a number of consistency checks described earlier. The execution of ENCLS[ECREATE] leaf function results in a #GP(0) in any of the following cases:

- SECS.ATTRIBUTES.XFRM[1:0] is not 3.
- The processor does not support XSAVE and any of the following is true:
  - SECS.ATTRIBUTES.XFRM[63:2] is not 0.
  - SECS.SSAFRAMESIZE is 0.
- The processor supports XSAVE and any of the following is true:
  - XSETBV would fault on an attempt to load XFRM into XCR0.
  - XFRM[63]=1.
  - The SSAFRAME is too small to hold required, enabled states (see Section 41.7.2.2).

### 41.7.4 Processor Extended States and ENCLU[EENTER]

#### 41.7.4.1 Fault Checking

The EENTER leaf function of the ENCLU instruction enforces a number of consistency requirements described earlier. The execution of the ENCLU[EENTER] leaf function results in a #GP(0) in any of the following cases:

- If CR4.OSFXSR=0.
- If The processor supports XSAVE and either of the following is true:
  - CR4.OSXSAVE=0 and SECS.ATTRIBUTES.XFRM is not 3.
  - (SECS.ATTRIBUTES.XFRM & XCR0) != SECS.ATTRIBUTES.XFRM

#### 41.7.4.2 State Loading

If ENCLU[EENTER] is successful, the current value of XCR0 is saved internally by the processor and replaced by SECS.ATTRIBUTES.XFRM.

## 41.7.5 Processor Extended States and AEX

### 41.7.5.1 State Saving

On an AEX, processor extended states are saved into the XSAVE area of the SSA frame in a compatible format with XSAVE that was executed with `EDX:EAX = SECS.ATTRIBUTES.XFRM`, with the memory operand being the XSAVE area, and (for 64-bit enclaves) as if `REX.W=1`. The `XSTATE_BV` part of the XSAVE header is saved with 0 for every bit that is 0 in XFRM. Other bits may be saved as 0 if the state saved is initialized.

Note that enclave entry ensures that if `CR4.OSXSAVE` is set to 0, then `SECS.ATTRIBUTES.XFRM` is set to 3. It should also be noted that it is not possible to enter an enclave with `FXSAVE` disabled.

### 41.7.5.2 State Synthesis

After saving the extended state, the processor restores `XCR0` to the value it held at the time of the most recent enclave entry.

The state of features corresponding to bits set in XFRM is synthesized. In general, these states are initialized. Details of state synthesis on AEX are documented in Section 39.3.1.

## 41.7.6 Processor Extended States and ENCLU[ERESUME]

### 41.7.6.1 Fault Checking

The ERESUME leaf function of the ENCLU instruction enforces a number of consistency requirements described earlier. Specifically, the ENCLU[ERESUME] leaf function results in a `#GP(0)` in any of the following cases:

- `CR4.OSFXSR=0`.
- The processor supports XSAVE and either of the following is true:
  - `CR4.OSXSAVE=0` and `SECS.ATTRIBUTES.XFRM` is not 3.
  - $(SECS.ATTRIBUTES.XFRM \& XCR0) \neq SECS.ATTRIBUTES.XFRM$ .

A successful execution of ENCLU[ERESUME] loads state from the XSAVE area of the SSA frame in a fashion similar to that used by the `XRSTOR` instruction. Data in the XSAVE area that would cause the `XRSTOR` instruction to fault will cause the ENCLU[ERESUME] leaf function to fault. Examples include, but are not restricted to the following:

- A bit is set in the `XSTATE_BV` field and clear in XFRM.
- The required bytes in the header are not clear.
- Loading data would set a reserved bit in `MXCSR`.

Any of these conditions will cause ERESUME to fault, even if `CR4.OSXSAVE=0`.

### 41.7.6.2 State Loading

If ENCLU[ERESUME] is successful, the current value of `XCR0` is saved internally by the processor and replaced by `SECS.ATTRIBUTES.XFRM`.

State is loaded from the XSAVE area of the SSA frame as if the `XRSTOR` instruction were executed with `XCR0=XFRM`, `EDX:EAX = XFRM`, with the memory operand being the XSAVE area, and (for 64-bit enclaves) as if `REX.W=1`.

ENCLU[ERESUME] ensures that a subsequent execution of `XSAVEOPT` inside the enclave will operate properly (e.g., by marking all state as modified).

## 41.7.7 Processor Extended States and ENCLU[EEXIT]

The ENCLU[EEXIT] leaf function does not perform any X-feature specific consistency checks, nor performs any state synthesis. It is the responsibility of enclave software to clear any sensitive data from the registers before

executing EEXIT. However, successful execution of the ENCLU[EEXIT] leaf function restores XCR0 to the value it held at the time of the most recent enclave entry.

### 41.7.8 Processor Extended States and ENCLU[EREPORT]

The ENCLU[EREPORT] leaf function creates the MAC-protected REPORT structure that reports on the enclave's identity. ENCLU[EREPORT] includes in the report the values of SECS.ATTRIBUTES.XFRM and SECS.MISCSELECT.

### 41.7.9 Processor Extended States and ENCLU[EGETKEY]

The ENCLU[EGETKEY] leaf function returns a cryptographic key based on the information provided by the KEYREQUEST structure. Intel SGX provides the means for isolation between different operating conditions by allowing an enclave developer to select which bits out of XFRM and MISCSELECT need to be included in the derivation of the keys.

## 41.8 INTERACTIONS WITH SMM

### 41.8.1 Availability of Intel® SGX instructions in SMM

Enclave instructions are not available in SMM, and any attempt to execute ENCLS or ENCLU instructions inside SMM results in an invalid-opcode exception (#UD).

### 41.8.2 SMI while Inside an Enclave

If the logical processor executing inside an enclave receives an SMI, the logical processor exits the enclave asynchronously. The response to an SMI received while executing inside an enclave depends on whether the dual-monitor treatment is enabled. For detailed discussion of transfer to SMM, see Chapter 34, "System Management Mode" of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C*.

If the logical processor executing inside an enclave receives an SMI when dual-monitor treatment is not enabled, the logical processor exits the enclave asynchronously, and transfers the control to the SMM handler. In addition to saving the synthetic architectural state to the SMRAM State Save Map (SSM), the logical processor also sets the "Enclave Interruption" bit in the SMRAM SSM (bit position 1 in SMRAM field at offset 7EE0H).

If the logical processor executing inside an enclave receives an SMI when dual-monitor treatment is enabled, the logical processor exits the enclave asynchronously, and transfers the control to the SMM monitor via SMM VM exit. The SMM VM exit sets the "Enclave Interruption" bit in the Exit Reason (see Table 41-2) and in the Guest Interruptibility State field (see Table 41-3) of the SMM VMCS.

### 41.8.3 SMRAM Synthetic State of AEX Triggered by SMI

All processor registers saved in the SMRAM have the same synthetic values listed in Section 39.3. Additional SMRAM fields that are treated specially on SMI are:

**Table 41-2. SMRAM Synthetic States on Asynchronous Enclave Exit**

| Position                  | Field                | Value                                     | Writable |
|---------------------------|----------------------|---|----------|
| SMRAM Offset 07EE0H.Bit 1 | ENCLAVE_INTERRUPTION | Set to 1 if exit occurred in enclave mode | No       |

## 41.9 INTERACTIONS OF INIT, SIPI, AND WAIT-FOR-SIPI WITH INTEL® SGX

INIT received inside an enclave, while the logical processor is not in VMX operation, causes the logical processor to exit the enclave asynchronously. After the AEX, the processor's architectural state is initialized to "Power-on" state (Table 9.1 in *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*). If the logical processor is BSP, then it proceeds to execute the BIOS initialization code. If the logical processor is an AP, it enters wait-for-SIPI state.

INIT received inside an enclave, while the logical processor (LP) is in VMX root operation, follows regular Intel Architecture behavior and is blocked.

INIT received inside an enclave, while the logical processor is in VMX non-root operation, causes an AEX. Subsequent to the AEX, the INIT causes a VM exit with the Enclave Interruption bit in the exit-reason field in the VMCS.

A processor cannot be inside an enclave in the wait-for-SIPI state. Consequently, a SIPI received while inside an enclave is lost.

Intel SGX does not change the behavior of the processor in the wait-for-SIPI state.

The SGX-related processor states after INIT-SIPI-SIPI is as follows:

- EPC Settings: Unchanged
- EPCM: Unchanged
- CPUID.LEAF\_12H.\*: Unchanged
- ENCLAVE\_MODE: 0 (LP exits enclave asynchronously)
- MEE state: Unchanged

Software should be aware that following INIT-SIPI-SIPI, the EPC might contain valid pages and should take appropriate measures such as initialize the EPC with the EREMOVE leaf function.

## 41.10 INTERACTIONS WITH DMA

DMA is not allowed to access any Processor Reserved Memory.

## 41.11 INTERACTIONS WITH TXT

### 41.11.1 Enclaves Created Prior to Execution of GETSEC

Enclaves which have been created before the GETSEC[SENDER] leaf function are available for execution after the successful completion of GETSEC[SENDER] and the corresponding SINIT ACM. Actions that a TXT Launched Environment performs in preparation to execute code in the Launched Environment, also applies to enclave code that would run after GETSEC[SENDER].

### 41.11.2 Interaction of GETSEC with Intel® SGX

All leaf functions of the GETSEC instruction are illegal inside an enclave, and results in an invalid-opcode exception (#UD).

Responding Logical Processors (RLP) which are executing inside an enclave at the time a GETSEC[SENDER] event occurs perform an AEX from the enclave and then enter the Wait-for-SIPI state.

RLP executing inside an enclave at the time of GETSEC[SEXIT], behave as defined for GETSEC[SEXIT]-that is, the RLPs pause during execution of SEXIT and resume after the completion of SEXIT.

The execution of a TXT launch does not affect Intel SGX configuration or security parameters.

### 41.11.3 Interactions with Authenticated Code Modules (ACMs)

Intel SGX only allows launching ACMs with an Intel SGX SVN that is at the same level or higher than the expected Intel SGX SVN. The expected Intel SGX SVN is specified by BIOS and locked down by the processor on the first successful execution of an Intel SGX instruction that doesn't return an error code. Intel SGX provides interfaces for system software to discover whether a non-faulting Intel SGX instruction has been executed, and evaluate the suitability of the Intel SGX SVN value of any ACM that is expected to be launched by the OS or the VMM.

These interfaces are provided through a read-only MSR called the IA32\_SGX\_SVN\_STATUS MSR (MSR address 500h). The IA32\_SGX\_SVN\_STATUS MSR has the format shown in Table 41-3.

**Table 41-3. Layout of the IA32\_SGX\_SVN\_STATUS MSR**

| Bit Position | Name          | ACM Module ID | Value  |
|--------------|---------------|---------------|--|
| 0            | Lock          | N.A.          | <ul style="list-style-type: none"> <li>If 1, indicates that a non-faulting Intel SGX instruction has been executed, consequently, launching a properly signed ACM but with Intel SGX SVN value less than the BIOS specified Intel SGX SVN threshold would lead to an TXT shutdown.</li> <li>If 0, indicates that the processor will allow a properly signed ACM to launch irrespective of the Intel SGX SVN value of the ACM.</li> </ul> |
| 15:1         | RSVD          | N.A.          | 0  |
| 23:16        | SGX_SVN_SINIT | SINIT ACM     | <ul style="list-style-type: none"> <li>If CPUID.01H:ECX.SMX = 1, this field reflects the expected threshold of Intel SGX SVN for the SINIT ACM.</li> <li>If CPUID.01H:ECX.SMX = 0, this field is reserved (0).</li> </ul>  |
| 63:24        | RSVD          | N.A.          | 0  |

OS/VMM that wishes to launch an architectural ACM such as SINIT is expected to read the IA32\_SGX\_SVN\_STATUS MSR to determine whether the ACM can be launched or a new ACM is needed:

- If either the Intel SGX SVN of the ACM is greater than the value reported by IA32\_SGX\_SVN\_STATUS, or the lock bit in the IA32\_SGX\_SVN\_STATUS is not set, then the OS/VMM can safely launch the ACM.
- If the Intel SGX SVN value reported in the corresponding component of the IA32\_SGX\_SVN\_STATUS is greater than the Intel SGX SVN value in the ACM's header, and if bit 0 of IA32\_SGX\_SVN\_STATUS is 1, then the OS/VMM should not launch that version of the ACM. It should obtain an updated version of the ACM either from the BIOS or from an external resource.

However, OSVs/VMMs are strongly advised to update their version of the ACM any time they detect that the Intel SGX SVN of the ACM carried by the OS/VMM is lower than that reported by IA32\_SGX\_SVN\_STATUS MSR, irrespective of the setting of the lock bit.

## 41.12 INTERACTIONS WITH CACHING OF LINEAR-ADDRESS TRANSLATIONS

Entering and exiting an enclave causes the logical processor to flush all the global linear-address context as well as the linear-address context associated with the current VPID and PCID. The MONITOR FSM is also cleared.

## 41.13 INTERACTIONS WITH INTEL® TRANSACTIONAL SYNCHRONIZATION EXTENSIONS (INTEL® TSX)

- ENCLU or ENCLS instructions inside an HLE region will cause the flow to be aborted and restarted non-speculatively. ENCLU or ENCLS instructions inside an RTM region will cause the flow to be aborted and transfer control to the fallback handler.
- If XBEGIN is executed inside an enclave, the processor does NOT check whether the address of the fallback handler is within the enclave.
- If an RTM transaction is executing inside an enclave and there is an attempt to fetch an instruction outside the enclave, the transaction is aborted and control is transferred to the fallback handler. No #GP is delivered.

4. If an RTM transaction is executing inside an enclave and there is a data access to an address within the enclave that denied due to EPCM content (e.g., to a page belonging to a different enclave), the transaction is aborted and control is transferred to the fallback handler. No #GP is delivered.

5. If an RTM transaction executing inside an enclave aborts and the address of the fallback handler is outside the enclave, a #GP is delivered after the abort (EIP reported is that of the fallback handler).

### 41.13.1 HLE and RTM Debug

RTM debug will be suppressed on opt-out enclave entry. After opt-out entry, the logical processor will behave as if `IA32_DEBUG_CTL[15]=0`. Any #DB detected inside an RTM transaction region will just cause an abort with no exception delivered.

After opt-in entry, if either `DR7[11] = 0` OR `IA32_DEBUGCTL[15] = 0`, any #DB or #BP detected inside an RTM transaction region will just cause an abort with no exception delivered.

After opt-in entry, if `DR7[11] = 1` AND `IA32_DEBUGCTL[15] = 1`, any #DB or #BP detected inside an RTM transaction will

- terminate speculative execution,
- set RIP to the address of the XBEGIN instruction, and
- be delivered as #DB (implying an Intel SGX AEX; any #BP is converted to #DB).
- `DR6[16]` will be cleared, indicating RTM debug (if the #DB causes a VM exit, `DR6` is not modified but bit 16 of the pending debug exceptions field in the VMCS will be set).

## 41.14 INTEL® SGX INTERACTIONS WITH S STATES

Whenever an Intel SGX enabled processor enters S3-S5 state, enclaves are destroyed. This is due to the EPC being destroyed when power down occurs. It is the application runtime's responsibility to re-instantiate an enclave after a power transition for which the enclaves were destroyed.

## 41.15 INTEL® SGX INTERACTIONS WITH MACHINE CHECK ARCHITECTURE (MCA)

### 41.15.1 Interactions with MCA Events

All architecturally visible machine check events (#MC and CMCI) that are detected while inside an enclave cause an asynchronous enclave exit.

Any machine check exception (#MC) that occurs after Intel SGX is first enables causes Intel SGX to be disabled, (`CPUID.SGX_Leaf.0:EAX[SGX1] == 0`). It cannot be enabled until after the next reset.

### 41.15.2 Machine Check Enables (IA32\_MCi\_CTL)

All supported `IA32_MCi_CTL` bits for all the machine check banks must be set for Intel SGX to be available (`CPUID.SGX_Leaf.0:EAX[SGX1] == 1`). Any act of clearing bits from '1' to '0' in any of the `IA32_MCi_CTL` register may disable Intel SGX (set `CPUID.SGX_Leaf.0:EAX[SGX1]` to 0) until the next reset.

### 41.15.3 CR4.MCE

`CR4.MCE` can be set or cleared with no interactions with Intel SGX.

## 41.16 INTEL® SGX INTERACTIONS WITH PROTECTED MODE VIRTUAL INTERRUPTS

ENCLS[EENTER] modifies neither EFLAGS.VIP nor EFLAGS.VIF.

ENCLS[ERESUME] loads EFLAGS in a manner similar to that of an execution of IRET with CPL = 3. This means that ERESUME modifies neither EFLAGS.VIP nor EFLAGS.VIF regardless of the value of the EFLAGS image in the SSA frame.

AEX saves EFLAGS.VIP and EFLAGS.VIF unmodified into the EFLAGS image in the SSA frame. AEX modifies neither EFLAGS.VIP nor EFLAGS.VIF after saving EFLAGS.

If CR4.PVI = 1, CPL = 3, EFLAGS.VM = 0, IOPL < 3, EFLAGS.VIP = 1, and EFLAGS.VIF = 0, execution of STI causes a #GP fault. In this case, STI modifies neither EFLAGS.IF nor EFLAGS.VIF. This behavior applies without change within an enclave (where CPL is always 3). Note that, if IOPL = 3, STI always sets EFLAGS.IF without fault; CR4.PVI, EFLAGS.VIP, and EFLAGS.VIF are neither consulted nor modified in this case.

## 41.17 INTEL SGX INTERACTION WITH PROTECTION KEYS

SGX interactions with PKRU are as follows:

- CPUID.(EAX=12H, ECX=1):ECX.PKRU indicates whether SECS.ATTRIBUTES.XFRM.PKRU can be set. If SECS.ATTRIBUTES.XFRM.PKRU is set, then PKRU is saved and cleared as part of AEX and is restored as part of ERESUME. If CR4.PKE is set, an enclave can execute RDPKRU and WRKRU independent of whether SECS.ATTRIBUTES.XFRM.PKRU is set.

SGX interactions with domain permission checks are as follows:

- 1) If CR4.PKE is not set, then legacy and SGX permission checks are not effected.
- 2) If CR4.PKE is set, then domain permission checks are applied to all non-enclave access and enclave accesses to user pages in addition to legacy and SGX permission checks at a higher priority than SGX permission checks.
- 3) Implicit accesses aren't subject to domain permission checks.

## 28. Updates to Appendix A, Volume 3D

Change bars show changes to Appendix A of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D: System Programming Guide, Part 4*.

Change to this chapter: Deletion of duplicate paragraph.

# APPENDIX A

## VMX CAPABILITY REPORTING FACILITY

The ability of a processor to support VMX operation and related instructions is indicated by CPUID.1:ECX.VMX[bit 5] = 1. A value 1 in this bit indicates support for VMX features.

Support for specific features detailed in Chapter 26 and other VMX chapters is determined by reading values from a set of capability MSRs. These MSRs are indexed starting at MSR address 480H. VMX capability MSRs are read-only; an attempt to write them (with WRMSR) produces a general-protection exception (#GP(0)). They do not exist on processors that do not support VMX operation; an attempt to read them (with RDMSR) on such processors produces a general-protection exception (#GP(0)).

### A.1 BASIC VMX INFORMATION

The IA32\_VMX\_BASIC MSR (index 480H) consists of the following fields:

- Bits 30:0 contain the 31-bit VMCS revision identifier used by the processor. Processors that use the same VMCS revision identifier use the same size for VMCS regions (see subsequent item on bits 44:32).<sup>1</sup>
- Bit 31 is always 0.
- Bits 44:32 report the number of bytes that software should allocate for the VMXON region and any VMCS region. It is a value greater than 0 and at most 4096 (bit 44 is set if and only if bits 43:32 are clear).
- Bit 48 indicates the width of the physical addresses that may be used for the VMXON region, each VMCS, and data structures referenced by pointers in a VMCS (I/O bitmaps, virtual-APIC page, MSR areas for VMX transitions). If the bit is 0, these addresses are limited to the processor's physical-address width.<sup>2</sup> If the bit is 1, these addresses are limited to 32 bits. This bit is always 0 for processors that support Intel 64 architecture.
- If bit 49 is read as 1, the logical processor supports the dual-monitor treatment of system-management interrupts and system-management mode. See Section 34.15 for details of this treatment.
- Bits 53:50 report the memory type that should be used for the VMCS, for data structures referenced by pointers in the VMCS (I/O bitmaps, virtual-APIC page, MSR areas for VMX transitions), and for the MSEG header. If software needs to access these data structures (e.g., to modify the contents of the MSR bitmaps), it can configure the paging structures to map them into the linear-address space. If it does so, it should establish mappings that use the memory type reported bits 53:50 in this MSR.<sup>3</sup>

As of this writing, all processors that support VMX operation indicate the write-back type. The values used are given in Table A-1.

**Table A-1. Memory Types Recommended for VMCS and Related Data Structures**

| Value(s) | Field            |
|----------|------------------|
| 0        | Uncacheable (UC) |
| 1-5      | Not used         |
| 6        | Write Back (WB)  |
| 7-15     | Not used         |

1. Earlier versions of this manual specified that the VMCS revision identifier was a 32-bit field in bits 31:0 of this MSR. For all processors produced prior to this change, bit 31 of this MSR was read as 0.
2. On processors that support Intel 64 architecture, the pointer must not set bits beyond the processor's physical address width.
3. Alternatively, software may map any of these regions or structures with the UC memory type. (This may be necessary for the MSEG header.) Doing so is discouraged unless necessary as it will cause the performance of software accesses to those structures to suffer.

- If bit 54 is read as 1, the processor reports information in the VM-exit instruction-information field on VM exits due to execution of the INS and OUTS instructions (see Section 27.2.4). This reporting is done only if this bit is read as 1.
- Bit 55 is read as 1 if any VMX controls that default to 1 may be cleared to 0. See Appendix A.2 for details. It also reports support for the VMX capability MSRs IA32\_VMX\_TRUE\_PINBASED\_CTLS, IA32\_VMX\_TRUE\_PROCBASED\_CTLS, IA32\_VMX\_TRUE\_EXIT\_CTLS, and IA32\_VMX\_TRUE\_ENTRY\_CTLS. See Appendix A.3.1, Appendix A.3.2, Appendix A.4, and Appendix A.5 for details.
- The values of bits 47:45 and bits 63:56 are reserved and are read as 0.

## A.2 RESERVED CONTROLS AND DEFAULT SETTINGS

As noted in Chapter 26, “VM Entries”, certain VMX controls are reserved and must be set to a specific value (0 or 1) determined by the processor. The specific value to which a reserved control must be set is its **default setting**. Software can discover the default setting of a reserved control by consulting the appropriate VMX capability MSR (see Appendix A.3 through Appendix A.5).

Future processors may define new functionality for one or more reserved controls. Such processors would allow each newly defined control to be set either to 0 or to 1. Software that does not desire a control’s new functionality should set the control to its default setting. For that reason, it is useful for software to know the default settings of the reserved controls.

Default settings partition the various controls into the following classes:

- **Always-flexible.** These have never been reserved.
- **Default0.** These are (or have been) reserved with a default setting of 0.
- **Default1.** They are (or have been) reserved with a default setting of 1.

As noted in Appendix A.1, a logical processor uses bit 55 of the IA32\_VMX\_BASIC MSR to indicate whether any of the default1 controls may be 0:

- If bit 55 of the IA32\_VMX\_BASIC MSR is read as 0, all the default1 controls are reserved and must be 1. VM entry will fail if any of these controls are 0 (see Section 26.2.1).
- If bit 55 of the IA32\_VMX\_BASIC MSR is read as 1, not all the default1 controls are reserved, and some (but not necessarily all) may be 0. The CPU supports four (4) new VMX capability MSRs: IA32\_VMX\_TRUE\_PINBASED\_CTLS, IA32\_VMX\_TRUE\_PROCBASED\_CTLS, IA32\_VMX\_TRUE\_EXIT\_CTLS, and IA32\_VMX\_TRUE\_ENTRY\_CTLS. See Appendix A.3 through Appendix A.5 for details. (These MSRs are not supported if bit 55 of the IA32\_VMX\_BASIC MSR is read as 0.)

See Section 31.5.1 for recommended software algorithms for proper capability detection of the default1 controls.

## A.3 VM-EXECUTION CONTROLS

There are separate capability MSRs for the pin-based VM-execution controls, the primary processor-based VM-execution controls, and the secondary processor-based VM-execution controls. These are described in Appendix A.3.1, Appendix A.3.2, and Appendix A.3.3, respectively.

### A.3.1 Pin-Based VM-Execution Controls

The IA32\_VMX\_PINBASED\_CTLS MSR (index 481H) reports on the allowed settings of most of the pin-based VM-execution controls (see Section 24.6.1):

- Bits 31:0 indicate the **allowed 0-settings** of these controls. VM entry allows control X (bit X of the pin-based VM-execution controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0.

Exceptions are made for the pin-based VM-execution controls in the default1 class (see Appendix A.2). These are bits 1, 2, and 4; the corresponding bits of the IA32\_VMX\_PINBASED\_CTLS MSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32\_VMX\_BASIC MSR:

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, VM entry fails if any pin-based VM-execution control in the default1 class is 0.
- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_PINBASED\_CTLMS MSR (see below) reports which of the pin-based VM-execution controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the **allowed 1-settings** of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_PINBASED\_CTLMS MSR (index 48DH) reports on the allowed settings of **all** of the pin-based VM-execution controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the pin-based VM-execution controls:

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, all information about the allowed settings of the pin-based VM-execution controls is contained in the IA32\_VMX\_PINBASED\_CTLMS MSR. (The IA32\_VMX\_TRUE\_PINBASED\_CTLMS MSR is not supported.)
- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, all information about the allowed settings of the pin-based VM-execution controls is contained in the IA32\_VMX\_TRUE\_PINBASED\_CTLMS MSR. Assuming that software knows that the default1 class of pin-based VM-execution controls contains bits 1, 2, and 4, there is no need for software to consult the IA32\_VMX\_PINBASED\_CTLMS MSR.

### A.3.2 Primary Processor-Based VM-Execution Controls

The IA32\_VMX\_PROCBASED\_CTLMS MSR (index 482H) reports on the allowed settings of **most** of the primary processor-based VM-execution controls (see Section 24.6.2):

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X (bit X of the primary processor-based VM-execution controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0.

Exceptions are made for the primary processor-based VM-execution controls in the default1 class (see Appendix A.2). These are bits 1, 4–6, 8, 13–16, and 26; the corresponding bits of the IA32\_VMX\_PROCBASED\_CTLMS MSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32\_VMX\_BASIC MSR:

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, VM entry fails if any of the primary processor-based VM-execution controls in the default1 class is 0.
- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_PROCBASED\_CTLMS MSR (see below) reports which of the primary processor-based VM-execution controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_PROCBASED\_CTLMS MSR (index 48EH) reports on the allowed settings of **all** of the primary processor-based VM-execution controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the primary processor-based VM-execution controls:

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, all information about the allowed settings of the primary processor-based VM-execution controls is contained in the IA32\_VMX\_PROCBASED\_CTLMS MSR. (The IA32\_VMX\_TRUE\_PROCBASED\_CTLMS MSR is not supported.)

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, all information about the allowed settings of the processor-based VM-execution controls is contained in the IA32\_VMX\_TRUE\_PROCBASED\_CTLMSR. Assuming that software knows that the default1 class of processor-based VM-execution controls contains bits 1, 4–6, 8, 13–16, and 26, there is no need for software to consult the IA32\_VMX\_PROCBASED\_CTLMSR.

### A.3.3 Secondary Processor-Based VM-Execution Controls

The IA32\_VMX\_PROCBASED\_CTLMSR (index 48BH) reports on the allowed settings of the secondary processor-based VM-execution controls (see Section 24.6.2). VM entries perform the following checks:

- Bits 31:0 indicate the allowed 0-settings of these controls. These bits are always 0. This fact indicates that VM entry allows each bit of the secondary processor-based VM-execution controls to be 0 (reserved bits must be 0)
- Bits 63:32 indicate the allowed 1-settings of these controls; the 1-setting is not allowed for any reserved bit. VM entry allows control X (bit X of the secondary processor-based VM-execution controls) to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X and the “activate secondary controls” primary processor-based VM-execution control are both 1.

The IA32\_VMX\_PROCBASED\_CTLMSR exists only on processors that support the 1-setting of the “activate secondary controls” VM-execution control (only if bit 63 of the IA32\_VMX\_PROCBASED\_CTLMSR is 1).

## A.4 VM-EXIT CONTROLS

The IA32\_VMX\_EXIT\_CTLMSR (index 483H) reports on the allowed settings of most of the VM-exit controls (see Section 24.7.1):

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X (bit X of the VM-exit controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. Exceptions are made for the VM-exit controls in the default1 class (see Appendix A.2). These are bits 0–8, 10, 11, 13, 14, 16, and 17; the corresponding bits of the IA32\_VMX\_EXIT\_CTLMSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32\_VMX\_BASIC MSR:
  - If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, VM entry fails if any VM-exit control in the default1 class is 0.
  - If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_EXIT\_CTLMSR (see below) reports which of the VM-exit controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control 32+X to be 1 if bit X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_EXIT\_CTLMSR (index 48FH) reports on the allowed settings of all of the VM-exit controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control X to be 1 if bit 32+X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the VM-exit controls:

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, all information about the allowed settings of the VM-exit controls is contained in the IA32\_VMX\_EXIT\_CTLMSR. (The IA32\_VMX\_TRUE\_EXIT\_CTLMSR is not supported.)
- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, all information about the allowed settings of the VM-exit controls is contained in the IA32\_VMX\_TRUE\_EXIT\_CTLMSR. Assuming that software knows that the default1 class of VM-exit controls contains bits 0–8, 10, 11, 13, 14, 16, and 17, there is no need for software to consult the IA32\_VMX\_EXIT\_CTLMSR.

## A.5 VM-ENTRY CONTROLS

The IA32\_VMX\_ENTRY\_CTLS MSR (index 484H) reports on the allowed settings of **most** of the VM-entry controls (see Section 24.8.1):

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X (bit X of the VM-entry controls) to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. Exceptions are made for the VM-entry controls in the default1 class (see Appendix A.2). These are bits 0–8 and 12; the corresponding bits of the IA32\_VMX\_ENTRY\_CTLS MSR are always read as 1. The treatment of these controls by VM entry is determined by bit 55 in the IA32\_VMX\_BASIC MSR:
  - If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, VM entry fails if any VM-entry control in the default1 class is 0.
  - If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_ENTRY\_CTLS MSR (see below) reports which of the VM-entry controls in the default1 class can be 0 on VM entry.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry fails if bit X is 1 in the VM-entry controls and bit 32+X is 0 in this MSR.

If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, the IA32\_VMX\_TRUE\_ENTRY\_CTLS MSR (index 490H) reports on the allowed settings of **all** of the VM-entry controls:

- Bits 31:0 indicate the allowed 0-settings of these controls. VM entry allows control X to be 0 if bit X in the MSR is cleared to 0; if bit X in the MSR is set to 1, VM entry fails if control X is 0. There are no exceptions.
- Bits 63:32 indicate the allowed 1-settings of these controls. VM entry allows control 32+X to be 1 if bit X in the MSR is set to 1; if bit 32+X in the MSR is cleared to 0, VM entry fails if control X is 1.

It is necessary for software to consult only one of the capability MSRs to determine the allowed settings of the VM-entry controls:

- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 0, all information about the allowed settings of the VM-entry controls is contained in the IA32\_VMX\_ENTRY\_CTLS MSR. (The IA32\_VMX\_TRUE\_ENTRY\_CTLS MSR is not supported.)
- If bit 55 in the IA32\_VMX\_BASIC MSR is read as 1, all information about the allowed settings of the VM-entry controls is contained in the IA32\_VMX\_TRUE\_ENTRY\_CTLS MSR. Assuming that software knows that the default1 class of VM-entry controls contains bits 0–8 and 12, there is no need for software to consult the IA32\_VMX\_ENTRY\_CTLS MSR.

## A.6 MISCELLANEOUS DATA

The IA32\_VMX\_MISC MSR (index 485H) consists of the following fields:

- Bits 4:0 report a value X that specifies the relationship between the rate of the VMX-preemption timer and that of the timestamp counter (TSC). Specifically, the VMX-preemption timer (if it is active) counts down by 1 every time bit X in the TSC changes due to a TSC increment.
- If bit 5 is read as 1, VM exits store the value of IA32\_EFER.LMA into the “IA-32e mode guest” VM-entry control; see Section 27.2 for more details. This bit is read as 1 on any logical processor that supports the 1-setting of the “unrestricted guest” VM-execution control.
- Bits 8:6 report, as a bitmap, the activity states supported by the implementation:
  - Bit 6 reports (if set) the support for activity state 1 (HLT).
  - Bit 7 reports (if set) the support for activity state 2 (shutdown).
  - Bit 8 reports (if set) the support for activity state 3 (wait-for-SIPI).

If an activity state is not supported, the implementation causes a VM entry to fail if it attempts to establish that activity state. All implementations support VM entry to activity state 0 (active).

- If bit 14 is read as 1, Intel® Processor Trace (Intel PT) can be used in VMX operation. If the processor supports Intel PT but does not allow it to be used in VMX operation, execution of VMXON clears IA32\_RTIT\_CTL.TraceEn (see “VMXON—Enter VMX Operation” in Chapter 30); any attempt to write IA32\_RTIT\_CTL while in VMX operation (including VMX root operation) causes a general-protection exception.

- If bit 15 is read as 1, the RDMSR instruction can be used in system-management mode (SMM) to read the IA32\_SMBASE MSR (MSR address 9EH). See Section 34.15.6.3.
- Bits 24:16 indicate the number of CR3-target values supported by the processor. This number is a value between 0 and 256, inclusive (bit 24 is set if and only if bits 23:16 are clear).
- Bits 27:25 is used to compute the recommended maximum number of MSRs that should appear in the VM-exit MSR-store list, the VM-exit MSR-load list, or the VM-entry MSR-load list. Specifically, if the value bits 27:25 of IA32\_VMX\_MISC is N, then  $512 * (N + 1)$  is the recommended maximum number of MSRs to be included in each list. If the limit is exceeded, undefined processor behavior may result (including a machine check during the VMX transition).
- If bit 28 is read as 1, bit 2 of the IA32\_SMM\_MONITOR\_CTL can be set to 1. VMXOFF unblocks SMIs unless IA32\_SMM\_MONITOR\_CTL[bit 2] is 1 (see Section 34.14.4).
- If bit 29 is read as 1, software can use VMWRITE to write to any supported field in the VMCS; otherwise, VMWRITE cannot be used to modify VM-exit information fields.
- If bit 30 is read as 1, VM entry allows injection of a software interrupt, software exception, or privileged software exception with an instruction length of 0.
- Bits 63:32 report the 32-bit MSEG revision identifier used by the processor.
- Bits 13:9 and bit 31 are reserved and are read as 0.

## A.7 VMX-FIXED BITS IN CR0

The IA32\_VMX\_CR0\_FIXED0 MSR (index 486H) and IA32\_VMX\_CR0\_FIXED1 MSR (index 487H) indicate how bits in CR0 may be set in VMX operation. They report on bits in CR0 that are allowed to be 0 and to be 1, respectively, in VMX operation. If bit X is 1 in IA32\_VMX\_CR0\_FIXED0, then that bit of CR0 is fixed to 1 in VMX operation. Similarly, if bit X is 0 in IA32\_VMX\_CR0\_FIXED1, then that bit of CR0 is fixed to 0 in VMX operation. It is always the case that, if bit X is 1 in IA32\_VMX\_CR0\_FIXED0, then that bit is also 1 in IA32\_VMX\_CR0\_FIXED1; if bit X is 0 in IA32\_VMX\_CR0\_FIXED1, then that bit is also 0 in IA32\_VMX\_CR0\_FIXED0. Thus, each bit in CR0 is either fixed to 0 (with value 0 in both MSRs), fixed to 1 (1 in both MSRs), or flexible (0 in IA32\_VMX\_CR0\_FIXED0 and 1 in IA32\_VMX\_CR0\_FIXED1).

## A.8 VMX-FIXED BITS IN CR4

The IA32\_VMX\_CR4\_FIXED0 MSR (index 488H) and IA32\_VMX\_CR4\_FIXED1 MSR (index 489H) indicate how bits in CR4 may be set in VMX operation. They report on bits in CR4 that are allowed to be 0 and 1, respectively, in VMX operation. If bit X is 1 in IA32\_VMX\_CR4\_FIXED0, then that bit of CR4 is fixed to 1 in VMX operation. Similarly, if bit X is 0 in IA32\_VMX\_CR4\_FIXED1, then that bit of CR4 is fixed to 0 in VMX operation. It is always the case that, if bit X is 1 in IA32\_VMX\_CR4\_FIXED0, then that bit is also 1 in IA32\_VMX\_CR4\_FIXED1; if bit X is 0 in IA32\_VMX\_CR4\_FIXED1, then that bit is also 0 in IA32\_VMX\_CR4\_FIXED0. Thus, each bit in CR4 is either fixed to 0 (with value 0 in both MSRs), fixed to 1 (1 in both MSRs), or flexible (0 in IA32\_VMX\_CR4\_FIXED0 and 1 in IA32\_VMX\_CR4\_FIXED1).

## A.9 VMCS ENUMERATION

The IA32\_VMX\_VMCS\_ENUM MSR (index 48AH) provides information to assist software in enumerating fields in the VMCS.

As noted in Section 24.11.2, each field in the VMCS is associated with a 32-bit encoding which is structured as follows:

- Bits 31:15 are reserved (must be 0).
- Bits 14:13 indicate the field's width.
- Bit 12 is reserved (must be 0).
- Bits 11:10 indicate the field's type.

- Bits 9:1 is an index field that distinguishes different fields with the same width and type.
- Bit 0 indicates access type.

IA32\_VMX\_VMCS\_ENUM indicates to software the highest index value used in the encoding of any field supported by the processor:

- Bits 9:1 contain the highest index value used for any VMCS encoding.
- Bit 0 and bits 63:10 are reserved and are read as 0.

## A.10 VPID AND EPT CAPABILITIES

The IA32\_VMX\_EPT\_VPID\_CAP MSR (index 48CH) reports information about the capabilities of the logical processor with regard to virtual-processor identifiers (VPIDs, Section 28.1) and extended page tables (EPT, Section 28.2):

- If bit 0 is read as 1, the processor supports execute-only translations by EPT. This support allows software to configure EPT paging-structure entries in which bits 1:0 are clear (indicating that data accesses are not allowed) and bit 2 is set (indicating that instruction fetches are allowed).<sup>1</sup>
- Bit 6 indicates support for a page-walk length of 4.
- If bit 8 is read as 1, the logical processor allows software to configure the EPT paging-structure memory type to be uncacheable (UC); see Section 24.6.11.
- If bit 14 is read as 1, the logical processor allows software to configure the EPT paging-structure memory type to be write-back (WB).
- If bit 16 is read as 1, the logical processor allows software to configure a EPT PDE to map a 2-Mbyte page (by setting bit 7 in the EPT PDE).
- If bit 17 is read as 1, the logical processor allows software to configure a EPT PDPTE to map a 1-Gbyte page (by setting bit 7 in the EPT PDPTE).
- Support for the INVEPT instruction (see Chapter 30 and Section 28.3.3.1).
  - If bit 20 is read as 1, the INVEPT instruction is supported.
  - If bit 25 is read as 1, the single-context INVEPT type is supported.
  - If bit 26 is read as 1, the all-context INVEPT type is supported.
- If bit 21 is read as 1, accessed and dirty flags for EPT are supported (see Section 28.2.4).
- If bit 22 is read as 1, the processor reports advanced VM-exit information for EPT violations (see Section 27.2.1). This reporting is done only if this bit is read as 1.
- Support for the INVVPID instruction (see Chapter 30 and Section 28.3.3.1).
  - If bit 32 is read as 1, the INVVPID instruction is supported.
  - If bit 40 is read as 1, the individual-address INVVPID type is supported.
  - If bit 41 is read as 1, the single-context INVVPID type is supported.
  - If bit 42 is read as 1, the all-context INVVPID type is supported.
  - If bit 43 is read as 1, the single-context-retaining-globals INVVPID type is supported.
- Bits 5:1, bit 7, bits 13:9, bit 15, bits 19:18, bits 24:23, bits 31:27, bits 39:33, and bits 63:44 are reserved and are read as 0.

---

1. If the “mode-based execute control for EPT” VM-execution control is 1, setting bit 0 indicates also that software may also configure EPT paging-structure entries in which bits 1:0 are both clear and in which bit 10 is set (indicating a translation that can be used to fetch instructions from a supervisor-mode linear address or a user-mode linear address).

The IA32\_VMX\_EPT\_VPID\_CAP MSR exists only on processors that support the 1-setting of the “activate secondary controls” VM-execution control (only if bit 63 of the IA32\_VMX\_PROCBASED\_CTL5 MSR is 1) and that support either the 1-setting of the “enable EPT” VM-execution control (only if bit 33 of the IA32\_VMX\_PROCBASED\_CTL52 MSR is 1) or the 1-setting of the “enable VPID” VM-execution control (only if bit 37 of the IA32\_VMX\_PROCBASED\_CTL52 MSR is 1).

## A.11 VM FUNCTIONS

The IA32\_VMX\_VMFUNC MSR (index 491H) reports on the allowed settings of the VM-function controls (see Section 24.6.14). VM entry allows bit X of the VM-function controls to be 1 if bit X in the MSR is set to 1; if bit X in the MSR is cleared to 0, VM entry fails if bit X of the VM-function controls, the “activate secondary controls” primary processor-based VM-execution control, and the “enable VM functions” secondary processor-based VM-execution control are all 1.

The IA32\_VMX\_VMFUNC MSR exists only on processors that support the 1-setting of the “activate secondary controls” VM-execution control (only if bit 63 of the IA32\_VMX\_PROCBASED\_CTL5 MSR is 1) and the 1-setting of the “enable VM functions” secondary processor-based VM-execution control (only if bit 45 of the IA32\_VMX\_PROCBASED\_CTL52 MSR is 1).

## 29. Updates to Chapter 2, Volume 4

Change bars show changes to Chapter 2 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 4: Model-Specific Registers*.

-----  
Changes to this chapter: Update comments for IA32\_SGXLEPUBKEYHASH0, IA32\_SGXLEPUBKEYHASH1, IA32\_SGXLEPUBKEYHASH2, and IA32\_SGXLEPUBKEYHASH3 MSRs. Updated MSR\_SGXOWNERPOCH0 and MSR\_SGXOWNERPOCH1 to indicate they are write only. Updated MSR\_BR\_DETECT\_CTRL with additional information regarding bits 17:8. Updated FREEZE\_WHILE\_SMM name.

## CHAPTER 2 MODEL-SPECIFIC REGISTERS (MSRS)

This chapter lists MSRs across Intel processor families. All MSRs listed can be read with the RDMSR and written with the WRMSR instructions.

Register addresses are given in both hexadecimal and decimal. The register name is the mnemonic register name and the bit description describes individual bits in registers.

Model specific registers and its bit-fields may be supported for a finite range of processor families/models. To distinguish between different processor family and/or models, software must use CPUID.01H leaf function to query the combination of DisplayFamily and DisplayModel to determine model-specific availability of MSRs (see CPUID instruction in Chapter 3, "Instruction Set Reference, A-L" in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2A*). Table 2-1 lists the signature values of DisplayFamily and DisplayModel for various processor families or processor number series.

**Table 2-1. CPUID Signature Values of DisplayFamily\_DisplayModel**

| DisplayFamily_DisplayModel | Processor Families/Processor Number Series   |
|----------------------------|--|
| 06_85H                     | Future Intel® Xeon Phi™ Processor based on Knights Mill microarchitecture  |
| 06_57H                     | Intel® Xeon Phi™ Processor 3200, 5200, 7200 Series based on Knights Landing microarchitecture  |
| 06_66H                     | Future Intel® Core™ processors based on Cannon Lake microarchitecture  |
| 06_8EH, 06_9EH             | 7th generation Intel® Core™ processors based on Kaby Lake microarchitecture  |
| 06_55H                     | Intel® Xeon® Processor Scalable Family based on Skylake microarchitecture  |
| 06_4EH, 06_5EH             | 6th generation Intel Core processors and Intel Xeon processor E3-1500m v5 product family and E3-1200 v5 product family based on Skylake microarchitecture                                      |
| 06_56H                     | Intel Xeon processor D-1500 product family based on Broadwell microarchitecture  |
| 06_4FH                     | Intel Xeon processor E5 v4 Family based on Broadwell microarchitecture, Intel Xeon processor E7 v4 Family, Intel Core i7-69xx Processor Extreme Edition  |
| 06_47H                     | 5th generation Intel Core processors, Intel Xeon processor E3-1200 v4 product family based on Broadwell microarchitecture  |
| 06_3DH                     | Intel Core M-5xxx Processor, 5th generation Intel Core processors based on Broadwell microarchitecture   |
| 06_3FH                     | Intel Xeon processor E5-4600/2600/1600 v3 product families, Intel Xeon processor E7 v3 product families based on Haswell-E microarchitecture, Intel Core i7-59xx Processor Extreme Edition     |
| 06_3CH, 06_45H, 06_46H     | 4th Generation Intel Core processor and Intel Xeon processor E3-1200 v3 product family based on Haswell microarchitecture  |
| 06_3EH                     | Intel Xeon processor E7-8800/4800/2800 v2 product families based on Ivy Bridge-E microarchitecture   |
| 06_3EH                     | Intel Xeon processor E5-2600/1600 v2 product families and Intel Xeon processor E5-2400 v2 product family based on Ivy Bridge-E microarchitecture, Intel Core i7-49xx Processor Extreme Edition |
| 06_3AH                     | 3rd Generation Intel Core Processor and Intel Xeon processor E3-1200 v2 product family based on Ivy Bridge microarchitecture   |
| 06_2DH                     | Intel Xeon processor E5 Family based on Intel microarchitecture code name Sandy Bridge, Intel Core i7-39xx Processor Extreme Edition   |
| 06_2FH                     | Intel Xeon Processor E7 Family   |
| 06_2AH                     | Intel Xeon processor E3-1200 product family; 2nd Generation Intel Core i7, i5, i3 Processors 2xxx Series   |
| 06_2EH                     | Intel Xeon processor 7500, 6500 series   |

**Table 2-1. CPUID Signature (Contd.)Values of DisplayFamily\_DisplayModel (Contd.)**

| DisplayFamily_DisplayModel             | Processor Families/Processor Number Series   |
|--|--|
| 06_25H, 06_2CH                         | Intel Xeon processors 3600, 5600 series, Intel Core i7, i5 and i3 Processors   |
| 06_1EH, 06_1FH                         | Intel Core i7 and i5 Processors  |
| 06_1AH                                 | Intel Core i7 Processor, Intel Xeon processor 3400, 3500, 5500 series  |
| 06_1DH                                 | Intel Xeon processor MP 7400 series  |
| 06_17H                                 | Intel Xeon processor 3100, 3300, 5200, 5400 series, Intel Core 2 Quad processors 8000, 9000 series   |
| 06_0FH                                 | Intel Xeon processor 3000, 3200, 5100, 5300, 7300 series, Intel Core 2 Quad processor 6000 series, Intel Core 2 Extreme 6000 series, Intel Core 2 Duo 4000, 5000, 6000, 7000 series processors, Intel Pentium dual-core processors |
| 06_0EH                                 | Intel Core Duo, Intel Core Solo processors   |
| 06_0DH                                 | Intel Pentium M processor  |
| 06_7AH                                 | Intel® Atom™ processors based on Goldmont Plus Microarchitecture   |
| 06_5FH                                 | Intel Atom processors based on Goldmont Microarchitecture (code name Denverton)  |
| 06_5CH                                 | Intel Atom processors based on Goldmont Microarchitecture  |
| 06_4CH                                 | Intel Atom processor X7-Z8000 and X5-Z8000 series based on Airmont Microarchitecture   |
| 06_5DH                                 | Intel Atom processor X3-C3000 based on Silvermont Microarchitecture  |
| 06_5AH                                 | Intel Atom processor Z3500 series  |
| 06_4AH                                 | Intel Atom processor Z3400 series  |
| 06_37H                                 | Intel Atom processor E3000 series, Z3600 series, Z3700 series  |
| 06_4DH                                 | Intel Atom processor C2000 series  |
| 06_36H                                 | Intel Atom processor S1000 Series  |
| 06_1CH, 06_26H, 06_27H, 06_35H, 06_36H | Intel Atom processor family, Intel Atom processor D2000, N2000, E2000, Z2000, C1000 series   |
| 0F_06H                                 | Intel Xeon processor 7100, 5000 Series, Intel Xeon Processor MP, Intel Pentium 4, Pentium D processors   |
| 0F_03H, 0F_04H                         | Intel Xeon processor, Intel Xeon processor MP, Intel Pentium 4, Pentium D processors   |
| 06_09H                                 | Intel Pentium M processor  |
| 0F_02H                                 | Intel Xeon Processor, Intel Xeon processor MP, Intel Pentium 4 processors  |
| 0F_0H, 0F_01H                          | Intel Xeon Processor, Intel Xeon processor MP, Intel Pentium 4 processors  |
| 06_7H, 06_08H, 06_0AH, 06_0BH          | Intel Pentium III Xeon processor, Intel Pentium III processor  |
| 06_03H, 06_05H                         | Intel Pentium II Xeon processor, Intel Pentium II processor  |
| 06_01H                                 | Intel Pentium Pro processor  |
| 05_01H, 05_02H, 05_04H                 | Intel Pentium processor, Intel Pentium processor with MMX Technology   |

The Intel® Quark™ SoC X1000 processor can be identified by the signature of DisplayFamily\_DisplayModel = 05\_09H and SteppingID = 0

## 2.1 ARCHITECTURAL MSRS

Many MSRs have carried over from one generation of IA-32 processors to the next and to Intel 64 processors. A subset of MSRs and associated bit fields, which do not change on future processor generations, are now considered architectural MSRs. For historical reasons (beginning with the Pentium 4 processor), these “architectural MSRs” were given the prefix “IA32\_”. Table 2-2 lists the architectural MSRs, their addresses, their current names, their names in previous IA-32 processors, and bit fields that are considered architectural. MSR addresses outside Table 2-2 and certain bit fields in an MSR address that may overlap with architectural MSR addresses are model-specific.

Code that accesses a machine specified MSR and that is executed on a processor that does not support that MSR will generate an exception.

Architectural MSR or individual bit fields in an architectural MSR may be introduced or transitioned at the granularity of certain processor family/model or the presence of certain CPUID feature flags. The right-most column of Table 2-2 provides information on the introduction of each architectural MSR or its individual fields. This information is expressed either as signature values of "DF\_DM" (see Table 2-1) or via CPUID flags.

Certain bit field position may be related to the maximum physical address width, the value of which is expressed as "MAXPHYADDR" in Table 2-2. "MAXPHYADDR" is reported by CPUID.8000\_0008H leaf.

MSR address range between 40000000H - 400000FFH is marked as a specially reserved range. All existing and future processors will not implement any features using any MSR in this range.

**Table 2-2. IA-32 Architectural MSRs**

| Register Address |         | Architectural MSR Name and bit fields<br>(Former MSR Name) | MSR/Bit Description   | Comment                           |
|------------------|---------|--|---|-----------------------------------|
| Hex              | Decimal |  |   |                                   |
| 0H               | 0       | IA32_P5_MC_ADDR (P5_MC_ADDR)                               | See Section 2.22, "MSRs in Pentium Processors."   | <b>Pentium Processor (05_01H)</b> |
| 1H               | 1       | IA32_P5_MC_TYPE (P5_MC_TYPE)                               | See Section 2.22, "MSRs in Pentium Processors."   | DF_DM = 05_01H                    |
| 6H               | 6       | IA32_MONITOR_FILTER_SIZE                                   | See Section 8.10.5, "Monitor/Mwait Address Range Determination."  | 0F_03H                            |
| 10H              | 16      | IA32_TIME_STAMP_COUNTER (TSC)                              | See Section 17.17, "Time-Stamp Counter."  | 05_01H                            |
| 17H              | 23      | IA32_PLATFORM_ID (MSR_PLATFORM_ID)                         | <b>Platform ID (RO)</b><br>The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load.   | 06_01H                            |
|                  |         | 49:0   | Reserved.   |                                   |
|                  |         | 52:50  | <b>Platform Id (RO)</b><br>Contains information concerning the intended platform for the processor.<br><br><div> <div>52 51 50</div> <div>0 0 0 Processor Flag 0</div> <div>0 0 1 Processor Flag 1</div> <div>0 1 0 Processor Flag 2</div> <div>0 1 1 Processor Flag 3</div> <div>1 0 0 Processor Flag 4</div> <div>1 0 1 Processor Flag 5</div> <div>1 1 0 Processor Flag 6</div> <div>1 1 1 Processor Flag 7</div> </div> |                                   |
|                  |         | 63:53  | Reserved.   |                                   |

**NOTES:**

1. In processors based on Intel NetBurst® microarchitecture, MSR addresses 180H-197H are supported, software must treat them as model-specific. Starting with Intel Core Duo processors, MSR addresses 180H-185H, 188H-197H are reserved.
2. The \*\_ADDR MSRs may or may not be present; this depends on flag settings in IA32\_MCI\_STATUS. See Section 15.3.2.3 and Section 15.3.2.4 for more information.
3. MAXPHYADDR is reported by CPUID.80000008H:EAX[7:0].

## 2.2 MSRS IN THE INTEL® CORE™ 2 PROCESSOR FAMILY

Table 2-3 lists model-specific registers (MSRs) for Intel Core 2 processor family and for Intel Xeon processors based on Intel Core microarchitecture, architectural MSR addresses are also included in Table 2-3. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_0FH, see Table 2-1.

MSRs listed in Table 2-2 and Table 2-3 are also supported by processors based on the Enhanced Intel Core microarchitecture. Processors based on the Enhanced Intel Core microarchitecture have the CPUID signature DisplayFamily\_DisplayModel of 06\_17H.

The column “Shared/Unique” applies to multi-core processors based on Intel Core microarchitecture. “Unique” means each processor core has a separate MSR, or a bit field in an MSR governs only a core independently. “Shared” means the MSR or the bit field in an MSR address governs the operation of both processor cores.

**Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture**

| Register Address |     | Register Name            | Shared/<br>Unique | Bit Description   |
|------------------|-----|--------------------------|-------------------|---|
| Hex              | Dec |                          |                   |   |

| 38EH             | 910  | IA32_PERF_GLOBAL_STATUS   | Unique            | See Table 2-2. See Section 18.6.2.2, "Global Counter Control Facilities."   |
| 38EH             | 910  | MSR_PERF_GLOBAL_STATUS    | Unique            | See Section 18.6.2.2, "Global Counter Control Facilities."  |
| 38FH             | 911  | IA32_PERF_GLOBAL_CTRL     | Unique            | See Table 2-2. See Section 18.6.2.2, "Global Counter Control Facilities."   |
| 38FH             | 911  | MSR_PERF_GLOBAL_CTRL      | Unique            | See Section 18.6.2.2, "Global Counter Control Facilities."  |
| 390H             | 912  | IA32_PERF_GLOBAL_OVF_CTRL | Unique            | See Table 2-2. See Section 18.6.2.2, "Global Counter Control Facilities."   |
| 390H             | 912  | MSR_PERF_GLOBAL_OVF_CTRL  | Unique            | See Section 18.6.2.2, "Global Counter Control Facilities."  |
| 3F1H             | 1009 | MSR_PEBES_ENABLE          | Unique            | See Table 2-2. See Section 18.6.2.4, "Processor Event Based Sampling (PEBS)."   |
|                  |      | 0                         |                   | Enable PEBS on IA32_PMC0. (R/W)   |
| 400H             | 1024 | IA32_MCO_CTL              | Unique            | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."  |
| 401H             | 1025 | IA32_MCO_STATUS           | Unique            | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs."   |
| 402H             | 1026 | IA32_MCO_ADDR             | Unique            | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."<br>The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MCO_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

| Register Address |      | Register Name   | Shared/<br>Unique | Bit Description   |
|------------------|------|-----------------|-------------------|---|
| Hex              | Dec  |                 |                   |   |
| 404H             | 1028 | IA32_MC1_CTL    | Unique            | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."  |
| 405H             | 1029 | IA32_MC1_STATUS | Unique            | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."   |
| 406H             | 1030 | IA32_MC1_ADDR   | Unique            | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."<br>The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC1_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 408H             | 1032 | IA32_MC2_CTL    | Unique            | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."  |
| 409H             | 1033 | IA32_MC2_STATUS | Unique            | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."   |
| 40AH             | 1034 | IA32_MC2_ADDR   | Unique            | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."<br>The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 40CH             | 1036 | IA32_MC4_CTL    | Unique            | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."  |
| 40DH             | 1037 | IA32_MC4_STATUS | Unique            | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."   |
| 40EH             | 1038 | IA32_MC4_ADDR   | Unique            | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."<br>The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.   |
| 410H             | 1040 | IA32_MC3_CTL    |                   | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."  |
| 411H             | 1041 | IA32_MC3_STATUS |                   | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."   |
| 412H             | 1042 | IA32_MC3_ADDR   | Unique            | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."<br>The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC3_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.   |
| 413H             | 1043 | IA32_MC3_MISC   | Unique            | Machine Check Error Reporting Register - contains additional information describing the machine-check error if the MISC_V flag in the IA32_MCi_STATUS register is set.  |
| 414H             | 1044 | IA32_MC5_CTL    | Unique            | Machine Check Error Reporting Register - controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).  |

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

| Register Address |      | Register Name          | Shared/<br>Unique | Bit Description  |
|------------------|------|------------------------|-------------------|--|
| Hex              | Dec  |                        |                   |  |
| 415H             | 1045 | IA32_MC5_STATUS        | Unique            | Machine Check Error Reporting Register - contains information related to a machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCI_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception. |
| 416H             | 1046 | IA32_MC5_ADDR          | Unique            | Machine Check Error Reporting Register - contains the address of the code or data memory location that produced the machine-check error if the ADDR_V flag in the IA32_MCI_STATUS register is set.   |
| 417H             | 1047 | IA32_MC5_MISC          | Unique            | Machine Check Error Reporting Register - contains additional information describing the machine-check error if the MISCV flag in the IA32_MCI_STATUS register is set.  |
| 419H             | 1045 | IA32_MC6_STATUS        | Unique            | Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 15.3.2.2, "IA32_MCI_STATUS MSRS," and Chapter 23.  |
| 480H             | 1152 | IA32_VMX_BASIC         | Unique            | <b>Reporting Register of Basic VMX Capabilities (R/O)</b><br>See Table 2-2.<br>See Appendix A.1, "Basic VMX Information."  |
| 481H             | 1153 | IA32_VMX_PINBASED_CTL  | Unique            | <b>Capability Reporting Register of Pin-based VM-execution Controls (R/O)</b><br>See Table 2-2.<br>See Appendix A.3, "VM-Execution Controls."  |
| 482H             | 1154 | IA32_VMX_PROCBASED_CTL | Unique            | <b>Capability Reporting Register of Primary Processor-based VM-execution Controls (R/O)</b><br>See Appendix A.3, "VM-Execution Controls."  |
| 483H             | 1155 | IA32_VMX_EXIT_CTL      | Unique            | <b>Capability Reporting Register of VM-exit Controls (R/O)</b><br>See Table 2-2.<br>See Appendix A.4, "VM-Exit Controls."  |
| 484H             | 1156 | IA32_VMX_ENTRY_CTL     | Unique            | <b>Capability Reporting Register of VM-entry Controls (R/O)</b><br>See Table 2-2.<br>See Appendix A.5, "VM-Entry Controls."  |
| 485H             | 1157 | IA32_VMX_MISC          | Unique            | <b>Reporting Register of Miscellaneous VMX Capabilities (R/O)</b><br>See Table 2-2.<br>See Appendix A.6, "Miscellaneous Data."   |
| 486H             | 1158 | IA32_VMX_CR0_FIXED0    | Unique            | <b>Capability Reporting Register of CR0 Bits Fixed to 0 (R/O)</b><br>See Table 2-2.<br>See Appendix A.7, "VMX-Fixed Bits in CR0."  |
| 487H             | 1159 | IA32_VMX_CR0_FIXED1    | Unique            | <b>Capability Reporting Register of CR0 Bits Fixed to 1 (R/O)</b><br>See Table 2-2.<br>See Appendix A.7, "VMX-Fixed Bits in CR0."  |

Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)

| Register Address |      | Register Name            | Shared/<br>Unique | Bit Description  |
|------------------|------|--------------------------|-------------------|--|
| Hex              | Dec  |                          |                   |  |
| 488H             | 1160 | IA32_VMX_CR4_FIXED0      | Unique            | <b>Capability Reporting Register of CR4 Bits Fixed to 0 (R/O)</b><br>See Table 2-2.<br>See Appendix A.8, “VMX-Fixed Bits in CR4.”                    |
| 489H             | 1161 | IA32_VMX_CR4_FIXED1      | Unique            | <b>Capability Reporting Register of CR4 Bits Fixed to 1 (R/O)</b><br>See Table 2-2.<br>See Appendix A.8, “VMX-Fixed Bits in CR4.”                    |
| 48AH             | 1162 | IA32_VMX_VMCS_ENUM       | Unique            | <b>Capability Reporting Register of VMCS Field Enumeration (R/O)</b><br>See Table 2-2.<br>See Appendix A.9, “VMCS Enumeration.”                      |
| 48BH             | 1163 | IA32_VMX_PROCBASED_CTL52 | Unique            | <b>Capability Reporting Register of Secondary Processor-based VM-execution Controls (R/O)</b><br>See Appendix A.3, “VM-Execution Controls.”          |
| 600H             | 1536 | IA32_DS_AREA             | Unique            | <b>DS Save Area (R/W)</b><br>See Table 2-2.<br>See Section 18.6.3.4, “Debug Store (DS) Mechanism.”   |
| 107CCH           |      | MSR_EMON_L3_CTR_CTL0     | Unique            | <b>GBUSQ Event Control/Counter Register (R/W)</b><br>Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.2.2  |
| 107CDH           |      | MSR_EMON_L3_CTR_CTL1     | Unique            | <b>GBUSQ Event Control/Counter Register (R/W)</b><br>Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.2.2  |
| 107CEH           |      | MSR_EMON_L3_CTR_CTL2     | Unique            | <b>GSPNPQ Event Control/Counter Register (R/W)</b><br>Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.2.2 |
| 107CFH           |      | MSR_EMON_L3_CTR_CTL3     | Unique            | <b>GSPNPQ Event Control/Counter Register (R/W)</b><br>Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.2.2 |
| 107D0H           |      | MSR_EMON_L3_CTR_CTL4     | Unique            | <b>FSB Event Control/Counter Register (R/W)</b><br>Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.2.2    |
| 107D1H           |      | MSR_EMON_L3_CTR_CTL5     | Unique            | <b>FSB Event Control/Counter Register (R/W)</b><br>Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.2.2    |
| 107D2H           |      | MSR_EMON_L3_CTR_CTL6     | Unique            | <b>FSB Event Control/Counter Register (R/W)</b><br>Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.2.2    |
| 107D3H           |      | MSR_EMON_L3_CTR_CTL7     | Unique            | <b>FSB Event Control/Counter Register (R/W)</b><br>Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.2.2    |

**Table 2-3. MSRs in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Register Address |     | Register Name       | Shared/<br>Unique | Bit Description   |
|------------------|-----|---------------------|-------------------|---|
| Hex              | Dec |                     |                   |   |
| 107D8H           |     | MSR_EMON_L3_GL_CTL  | Unique            | <b>L3/FSB Common Control Register (R/W)</b><br>Apply to Intel Xeon processor 7400 series (processor signature 06_1D) only. See Section 17.2.2 |
| C000_0080H       |     | IA32_EFER           | Unique            | <b>Extended Feature Enables</b><br>See Table 2-2.   |
| C000_0081H       |     | IA32_STAR           | Unique            | <b>System Call Target Address (R/W)</b><br>See Table 2-2.   |
| C000_0082H       |     | IA32_LSTAR          | Unique            | <b>IA-32e Mode System Call Target Address (R/W)</b><br>See Table 2-2.   |
| C000_0084H       |     | IA32_FMASK          | Unique            | <b>System Call Flag Mask (R/W)</b><br>See Table 2-2.  |
| C000_0100H       |     | IA32_FS_BASE        | Unique            | <b>Map of BASE Address of FS (R/W)</b><br>See Table 2-2.  |
| C000_0101H       |     | IA32_GS_BASE        | Unique            | <b>Map of BASE Address of GS (R/W)</b><br>See Table 2-2.  |
| C000_0102H       |     | IA32_KERNEL_GS_BASE | Unique            | <b>Swap Target of BASE Address of GS (R/W)</b> See Table 2-2.   |

## 2.3 MSRS IN THE 45 NM AND 32 NM INTEL® ATOM™ PROCESSOR FAMILY

Table 2-4 lists model-specific registers (MSRs) for 45 nm and 32 nm Intel Atom processors, architectural MSR addresses are also included in Table 2-4. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_1CH, 06\_26H, 06\_27H, 06\_35H and 06\_36H; see Table 2-1.

The column “Shared/Unique” applies to logical processors sharing the same core in processors based on the Intel Atom microarchitecture. “Unique” means each logical processor has a separate MSR, or a bit field in an MSR governs only a logical processor. “Shared” means the MSR or the bit field in an MSR address governs the operation of both logical processors in the same core.

**Table 2-4. MSRs in 45 nm and 32 nm Intel® Atom™ Processor Family**

| Register Address |     | Register Name            | Shared/<br>Unique | Bit Description  |
|------------------|-----|--------------------------|-------------------|--|
| Hex              | Dec |                          |                   |  |
| 0H               | 0   | IA32_P5_MC_ADDR          | Shared            | See Section 2.22, “MSRs in Pentium Processors.”                                |
| 1H               | 1   | IA32_P5_MC_TYPE          | Shared            | See Section 2.22, “MSRs in Pentium Processors.”                                |
| 6H               | 6   | IA32_MONITOR_FILTER_SIZE | Unique            | See Section 8.10.5, “Monitor/Mwait Address Range Determination,” and Table 2-2 |
| 10H              | 16  | IA32_TIME_STAMP_COUNTER  | Unique            | See Section 17.17, “Time-Stamp Counter,” and see Table 2-2.                    |
| 17H              | 23  | IA32_PLATFORM_ID         | Shared            | <b>Platform ID (R)</b><br>See Table 2-2.                                       |

Table 2-4. MSRs in 45 nm and 32 nm Intel® Atom™ Processor Family (Contd.)

| Register Address |     | Register Name      | Shared/<br>Unique | Bit Description   |
|------------------|-----|--------------------|-------------------|---|
| Hex              | Dec |                    |                   |   |
| 17H              | 23  | MSR_PLATFORM_ID    | Shared            | <b>Model Specific Platform ID (R)</b>   |
|                  |     | 7:0                |                   | Reserved.   |
|                  |     | 12:8               |                   | <b>Maximum Qualified Ratio (R)</b><br>The maximum allowed bus ratio.  |
|                  |     | 63:13              |                   | Reserved.   |
| 1BH              | 27  | IA32_APIC_BASE     | Unique            | See Section 10.4.4, “Local APIC Status and Location,” and Table 2-2.  |
| 2AH              | 42  | MSR_EBL_CR_POWERON | Shared            | <b>Processor Hard Power-On Configuration (R/W)</b> Enables and disables processor features;<br>(R) indicates current processor configuration. |
|                  |     | 0                  |                   | Reserved.   |
|                  |     | 1                  |                   | <b>Data Error Checking Enable (R/W)</b><br>1 = Enabled; 0 = Disabled<br>Always 0.   |
|                  |     | 2                  |                   | <b>Response Error Checking Enable (R/W)</b><br>1 = Enabled; 0 = Disabled<br>Always 0.   |
|                  |     | 3                  |                   | <b>AERR# Drive Enable (R/W)</b><br>1 = Enabled; 0 = Disabled<br>Always 0.   |
|                  |     | 4                  |                   | <b>BERR# Enable for initiator bus requests (R/W)</b><br>1 = Enabled; 0 = Disabled<br>Always 0.  |

Table 2-5 lists model-specific registers (MSRs) that are specific to Intel® Atom™ processor with the CPUID signature with DisplayFamily\_DisplayModel of 06\_27H.

**Table 2-5. MSRs Supported by Intel® Atom™ Processors with CPUID Signature 06\_27H**

| Register Address |      | Register Name        | Scope   | Bit Description   |
|------------------|------|----------------------|---------|---|
| Hex              | Dec  |                      |         |   |
| 3F8H             | 1016 | MSR_PKG_C2_RESIDENCY | Package | <b>Package C2 Residency</b><br>Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States |
|                  |      | 63:0                 | Package | Package C2 Residency Counter. (R/O)<br>Time that this package is in processor-specific C2 states since last reset. Counts at 1 Mhz frequency.                   |

**Table 2-5. MSRs Supported by Intel® Atom™ Processors (Contd.)with CPUID Signature 06\_27H**

| Register Address |      | Register Name        | Scope   | Bit Description   |
|------------------|------|----------------------|---------|---|
| Hex              | Dec  |                      |         |   |
| 3F9H             | 1017 | MSR_PKG_C4_RESIDENCY | Package | <b>Package C4 Residency</b><br>Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States |
|                  |      | 63:0                 | Package | Package C4 Residency Counter. (R/O)<br>Time that this package is in processor-specific C4 states since last reset. Counts at 1 Mhz frequency.                   |
| 3FAH             | 1018 | MSR_PKG_C6_RESIDENCY | Package | <b>Package C6 Residency</b><br>Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States |
|                  |      | 63:0                 | Package | Package C6 Residency Counter. (R/O)<br>Time that this package is in processor-specific C6 states since last reset. Counts at 1 Mhz frequency.                   |

## 2.4 MSRS IN INTEL PROCESSORS BASED ON SILVERMONT MICROARCHITECTURE

Table 2-6 lists model-specific registers (MSRs) common to Intel processors based on the Silvermont microarchitecture. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_37H, 06\_4AH, 06\_4DH, 06\_5AH, and 06\_5DH; see Table 2-1. The MSRs listed in Table 2-6 are also common to processors based on the Airmont microarchitecture and newer microarchitectures for next generation Intel Atom processors.

Table 2-7 lists MSRs common to processors based on the Silvermont and Airmont microarchitectures, but not newer microarchitectures.

Table 2-8, Table 2-9, and Table 2-10 lists MSRs that are model-specific across processors based on the Silvermont microarchitecture.

In the Silvermont microarchitecture, the scope column indicates the following: “Core” means each processor core has a separate MSR, or a bit field not shared with another processor core. “Module” means the MSR or the bit field is shared by a pair of processor cores in the physical package. “Package” means all processor cores in the physical package share the same MSR or bit interface.

**Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors**

| Address |     | Register Name            | Scope  | Bit Description  |
|---------|-----|--------------------------|--------|--|
| Hex     | Dec |                          |        |  |
| 0H      | 0   | IA32_P5_MC_ADDR          | Module | See Section 2.22, “MSRs in Pentium Processors.”                                |
| 1H      | 1   | IA32_P5_MC_TYPE          | Module | See Section 2.22, “MSRs in Pentium Processors.”                                |
| 6H      | 6   | IA32_MONITOR_FILTER_SIZE | Core   | See Section 8.10.5, “Monitor/Mwait Address Range Determination,” and Table 2-2 |
| 10H     | 16  | IA32_TIME_STAMP_COUNTER  | Core   | See Section 17.17, “Time-Stamp Counter,” and see Table 2-2.                    |
| 1BH     | 27  | IA32_APIC_BASE           | Core   | See Section 10.4.4, “Local APIC Status and Location,” and Table 2-2.           |
| 2AH     | 42  | MSR_EBL_CR_POWERON       | Module | <b>Processor Hard Power-On Configuration (R/W)</b> Writes ignored.             |
|         |     | 63:0                     |        | Reserved (R/O)   |

**Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors**

| Address |     | Register Name           | Scope  | Bit Description   |
|---------|-----|-------------------------|--------|---|
| Hex     | Dec |                         |        |   |
| 34H     | 52  | MSR_SMI_COUNT           | Core   | <b>SMI Counter (R/O)</b>  |
|         |     | 31:0                    |        | <b>SMI Count (R/O)</b><br>Running count of SMI events since last RESET.   |
|         |     | 63:32                   |        | Reserved.   |
| 79H     | 121 | IA32_BIOS_UPDT_TRIG     | Core   | <b>BIOS Update Trigger Register (W)</b><br>See Table 2-2.   |
| 8BH     | 139 | IA32_BIOS_SIGN_ID       | Core   | <b>BIOS Update Signature ID (RO)</b><br>See Table 2-2.  |
| C1H     | 193 | IA32_PMC0               | Core   | <b>Performance counter register</b><br>See Table 2-2.   |
| C2H     | 194 | IA32_PMC1               | Core   | <b>Performance Counter Register</b><br>See Table 2-2.   |
| E4H     | 228 | MSR_PMG_IO_CAPTURE_BASE | Module | <b>Power Management IO Redirection in C-state (R/W)</b><br>See <a href="http://biosbits.org">http://biosbits.org</a> .  |
|         |     | 15:0                    |        | <b>LVL_2 Base Address (R/W)</b><br>Specifies the base address visible to software for IO redirection. If IO MWAIT Redirection is enabled, reads to this address will be consumed by the power management logic and decoded to MWAIT instructions. When IO port address redirection is enabled, this is the IO port address reported to the OS/software. |
|         |     | 18:16                   |        | <b>C-state Range (R/W)</b><br>Specifies the encoding value of the maximum C-State code name to be included when IO read to MWAIT redirection is enabled by MSR_PKG_CST_CONFIG_CONTROL[bit10]:<br>100b - C4 is the max C-State to include<br>110b - C6 is the max C-State to include<br>111b - C7 is the max C-State to include                          |
|         |     | 63:19                   |        | Reserved.   |
| E7H     | 231 | IA32_MPERF              | Core   | <b>Maximum Performance Frequency Clock Count (RW)</b><br>See Table 2-2.   |
| E8H     | 232 | IA32_APERF              | Core   | <b>Actual Performance Frequency Clock Count (RW)</b><br>See Table 2-2.  |
| FEH     | 254 | IA32_MTRRCAP            | Core   | <b>Memory Type Range Register (R)</b><br>See Table 2-2.   |
| 13CH    | 52  | MSR_FEATURE_CONFIG      | Core   | <b>AES Configuration (RW-L)</b><br>Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.   |

**Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors**

| Address |     | Register Name     | Scope | Bit Description   |
|---------|-----|-------------------|-------|---|
| Hex     | Dec |                   |       |   |
|         |     | 1:0               |       | <b>AES Configuration (RW-L)</b><br>Upon a successful read of this MSR, the configuration of AES instruction set availability is as follows:<br>1 1b: AES instructions are not available until next RESET.<br>otherwise, AES instructions are available.<br>Note, AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instruction can be mis-configured if a privileged agent unintentionally writes 11b. |
|         |     | 63:2              |       | Reserved.   |
| 174H    | 372 | IA32_SYSENTER_CS  | Core  | See Table 2-2.  |
| 175H    | 373 | IA32_SYSENTER_ESP | Core  | See Table 2-2.  |
| 176H    | 374 | IA32_SYSENTER_EIP | Core  | See Table 2-2.  |
| 179H    | 377 | IA32_MCG_CAP      | Core  | See Table 2-2.  |
| 17AH    | 378 | IA32_MCG_STATUS   | Core  | Global Machine Check Status   |
|         |     | 0                 |       | <b>RIPV</b><br>When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If cleared, the program cannot be reliably restarted  |
|         |     | 1                 |       | <b>EIPV</b><br>When set, bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.  |
|         |     | 2                 |       | <b>MCIP</b><br>When set, bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception.   |
|         |     | 63:3              |       | Reserved.   |
| 186H    | 390 | IA32_PERFVTSELO   | Core  | See Table 2-2.  |

| 38DH    | 909  | IA32_FIXED_CTR_CTRL    | Core   | <b>Fixed-Function-Counter Control Register (R/W)</b><br>See Table 2-2.  |
| 38FH    | 911  | IA32_PERF_GLOBAL_CTRL  | Core   | See Table 2-2. See Section 18.6.2.2, “Global Counter Control Facilities.”   |
| 3FDH    | 1021 | MSR_CORE_C6_RESIDENCY  | Core   | Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.   |
|         |      | 63:0                   |        | CORE C6 Residency Counter. (R/O)<br>Value since last reset that this core is in processor-specific C6 states. Counts at the TSC Frequency.  |
| 400H    | 1024 | IA32_MCO_CTL           | Module | See Section 15.3.2.1, “IA32_MCi_CTL MSRs.”  |
| 401H    | 1025 | IA32_MCO_STATUS        | Module | See Section 15.3.2.2, “IA32_MCi_STATUS MSRS.”   |
| 402H    | 1026 | IA32_MCO_ADDR          | Module | See Section 15.3.2.3, “IA32_MCi_ADDR MSRs.”<br>The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MCO_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 404H    | 1028 | IA32_MC1_CTL           | Module | See Section 15.3.2.1, “IA32_MCi_CTL MSRs.”  |
| 405H    | 1029 | IA32_MC1_STATUS        | Module | See Section 15.3.2.2, “IA32_MCi_STATUS MSRS.”   |
| 408H    | 1032 | IA32_MC2_CTL           | Module | See Section 15.3.2.1, “IA32_MCi_CTL MSRs.”  |
| 409H    | 1033 | IA32_MC2_STATUS        | Module | See Section 15.3.2.2, “IA32_MCi_STATUS MSRS.”   |
| 40AH    | 1034 | IA32_MC2_ADDR          | Module | See Section 15.3.2.3, “IA32_MCi_ADDR MSRs.”<br>The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 40CH    | 1036 | IA32_MC3_CTL           | Core   | See Section 15.3.2.1, “IA32_MCi_CTL MSRs.”  |
| 40DH    | 1037 | IA32_MC3_STATUS        | Core   | See Section 15.3.2.2, “IA32_MCi_STATUS MSRS.”   |
| 40EH    | 1038 | IA32_MC3_ADDR          | Core   | See Section 15.3.2.3, “IA32_MCi_ADDR MSRs.”<br>The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC3_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.   |
| 410H    | 1040 | IA32_MC4_CTL           | Core   | See Section 15.3.2.1, “IA32_MCi_CTL MSRs.”  |
| 411H    | 1041 | IA32_MC4_STATUS        | Core   | See Section 15.3.2.2, “IA32_MCi_STATUS MSRS.”   |

**Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors**

| Address |      | Register Name          | Scope   | Bit Description   |
|---------|------|------------------------|---------|---|
| Hex     | Dec  |                        |         |   |
| 412H    | 1042 | IA32_MC4_ADDR          | Core    | See Section 15.3.2.3, “IA32_MCI_ADDR MSRs.”<br>The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 414H    | 1044 | IA32_MC5_CTL           | Package | See Section 15.3.2.1, “IA32_MCI_CTL MSRs.”  |
| 415H    | 1045 | IA32_MC5_STATUS        | Package | See Section 15.3.2.2, “IA32_MCI_STATUS MSRs.”   |
| 416H    | 1046 | IA32_MC5_ADDR          | Package | See Section 15.3.2.3, “IA32_MCI_ADDR MSRs.”<br>The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 480H    | 1152 | IA32_VMX_BASIC         | Core    | <b>Reporting Register of Basic VMX Capabilities (R/O)</b><br>See Table 2-2.<br>See Appendix A.1, “Basic VMX Information.”   |
| 481H    | 1153 | IA32_VMX_PINBASED_CTL  | Core    | <b>Capability Reporting Register of Pin-based VM-execution Controls (R/O)</b><br>See Table 2-2.<br>See Appendix A.3, “VM-Execution Controls.”   |
| 482H    | 1154 | IA32_VMX_PROCBASED_CTL | Core    | <b>Capability Reporting Register of Primary Processor-based VM-execution Controls (R/O)</b><br>See Appendix A.3, “VM-Execution Controls.”   |
| 483H    | 1155 | IA32_VMX_EXIT_CTL      | Core    | <b>Capability Reporting Register of VM-exit Controls (R/O)</b><br>See Table 2-2.<br>See Appendix A.4, “VM-Exit Controls.”   |
| 484H    | 1156 | IA32_VMX_ENTRY_CTL     | Core    | <b>Capability Reporting Register of VM-entry Controls (R/O)</b><br>See Table 2-2.<br>See Appendix A.5, “VM-Entry Controls.”   |
| 485H    | 1157 | IA32_VMX_MISC          | Core    | <b>Reporting Register of Miscellaneous VMX Capabilities (R/O)</b><br>See Table 2-2.<br>See Appendix A.6, “Miscellaneous Data.”  |
| 486H    | 1158 | IA32_VMX_CR0_FIXED0    | Core    | <b>Capability Reporting Register of CR0 Bits Fixed to 0 (R/O)</b><br>See Table 2-2.<br>See Appendix A.7, “VMX-Fixed Bits in CR0.”   |
| 487H    | 1159 | IA32_VMX_CR0_FIXED1    | Core    | <b>Capability Reporting Register of CR0 Bits Fixed to 1 (R/O)</b><br>See Table 2-2.<br>See Appendix A.7, “VMX-Fixed Bits in CR0.”   |
| 488H    | 1160 | IA32_VMX_CR4_FIXED0    | Core    | <b>Capability Reporting Register of CR4 Bits Fixed to 0 (R/O)</b><br>See Table 2-2.<br>See Appendix A.8, “VMX-Fixed Bits in CR4.”   |

**Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors**

| Address    |      | Register Name                 | Scope | Bit Description   |
|------------|------|-------------------------------|-------|---|
| Hex        | Dec  |                               |       |   |
| 489H       | 1161 | IA32_VMX_CR4_FIXED1           | Core  | <b>Capability Reporting Register of CR4 Bits Fixed to 1 (R/O)</b><br>See Table 2-2.<br>See Appendix A.8, “VMX-Fixed Bits in CR4.”           |
| 48AH       | 1162 | IA32_VMX_VMCS_ENUM            | Core  | <b>Capability Reporting Register of VMCS Field Enumeration (R/O)</b><br>See Table 2-2.<br>See Appendix A.9, “VMCS Enumeration.”             |
| 48BH       | 1163 | IA32_VMX_PROCBASED_CTLSS2     | Core  | <b>Capability Reporting Register of Secondary Processor-based VM-execution Controls (R/O)</b><br>See Appendix A.3, “VM-Execution Controls.” |
| 48CH       | 1164 | IA32_VMX_EPT_VPID_ENUM        | Core  | <b>Capability Reporting Register of EPT and VPID (R/O)</b><br>See Table 2-2   |
| 48DH       | 1165 | IA32_VMX_TRUE_PINBASED_CTLSS  | Core  | <b>Capability Reporting Register of Pin-based VM-execution Flex Controls (R/O)</b><br>See Table 2-2   |
| 48EH       | 1166 | IA32_VMX_TRUE_PROCBASED_CTLSS | Core  | <b>Capability Reporting Register of Primary Processor-based VM-execution Flex Controls (R/O)</b><br>See Table 2-2                           |
| 48FH       | 1167 | IA32_VMX_TRUE_EXIT_CTLSS      | Core  | <b>Capability Reporting Register of VM-exit Flex Controls (R/O)</b><br>See Table 2-2  |
| 490H       | 1168 | IA32_VMX_TRUE_ENTRY_CTLSS     | Core  | <b>Capability Reporting Register of VM-entry Flex Controls (R/O)</b><br>See Table 2-2   |
| 491H       | 1169 | IA32_VMX_FMFUNC               | Core  | <b>Capability Reporting Register of VM-function Controls (R/O)</b><br>See Table 2-2   |
| 4C1H       | 1217 | IA32_A_PMC0                   | Core  | See Table 2-2.  |
| 4C2H       | 1218 | IA32_A_PMC1                   | Core  | See Table 2-2.  |
| 600H       | 1536 | IA32_DS_AREA                  | Core  | <b>DS Save Area (R/W)</b><br>See Table 2-2.<br>See Section 18.6.3.4, “Debug Store (DS) Mechanism.”  |
| 660H       | 1632 | MSR_CORE_C1_RESIDENCY         | Core  | Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.           |
|            |      | 63:0                          |       | CORE C1 Residency Counter. (R/O)<br>Value since last reset that this core is in processor-specific C1 states. Counts at the TSC frequency.  |
| 6E0H       | 1760 | IA32_TSC_DEADLINE             | Core  | <b>TSC Target of Local APIC's TSC Deadline Mode (R/W)</b><br>See Table 2-2  |
| C000_0080H |      | IA32_EFER                     | Core  | <b>Extended Feature Enables</b><br>See Table 2-2.   |
| C000_0081H |      | IA32_STAR                     | Core  | <b>System Call Target Address (R/W)</b><br>See Table 2-2.   |

**Table 2-6. MSRs Common to the Silvermont Microarchitecture and Newer Microarchitectures for Intel Atom Processors**

| Address    |     | Register Name       | Scope | Bit Description   |
|------------|-----|---------------------|-------|---|
| Hex        | Dec |                     |       |   |
| C000_0082H |     | IA32_LSTAR          | Core  | <b>IA-32e Mode System Call Target Address (R/W)</b><br>See Table 2-2. |
| C000_0084H |     | IA32_FMASK          | Core  | <b>System Call Flag Mask (R/W)</b><br>See Table 2-2.                  |
| C000_0100H |     | IA32_FS_BASE        | Core  | <b>Map of BASE Address of FS (R/W)</b><br>See Table 2-2.              |
| C000_0101H |     | IA32_GS_BASE        | Core  | <b>Map of BASE Address of GS (R/W)</b><br>See Table 2-2.              |
| C000_0102H |     | IA32_KERNEL_GS_BASE | Core  | <b>Swap Target of BASE Address of GS (R/W)</b> See Table 2-2.         |
| C000_0103H |     | IA32_TSC_AUX        | Core  | <b>AUXILIARY TSC Signature. (R/W)</b> See Table 2-2                   |

Table 2-7 lists model-specific registers (MSRs) that are common to Intel® Atom™ processors based on the Silvermont and Airmont microarchitectures but not newer microarchitectures.

**Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures**

| Register Address |     | Register Name            | Scope  | Bit Description  |
|------------------|-----|--------------------------|--------|--|
| Hex              | Dec |                          |        |  |
| 17H              | 23  | MSR_PLATFORM_ID          | Module | <b>Model Specific Platform ID (R)</b>  |
|                  |     | 7:0                      |        | Reserved.  |
|                  |     | 13:8                     |        | <b>Maximum Qualified Ratio (R)</b><br>The maximum allowed bus ratio.   |
|                  |     | 49:13                    |        | Reserved.  |
|                  |     | 52:50                    |        | <b>See Table 2-2</b>   |
|                  |     | 63:33                    |        | Reserved.  |
| 3AH              | 58  | IA32_FEATURE_CONTROL     | Core   | <b>Control Features in Intel 64Processor (R/W)</b><br>See Table 2-2.   |
|                  |     | 0                        |        | <b>Lock (R/WL)</b>   |
|                  |     | 1                        |        | <b>Reserved</b>  |
|                  |     | 2                        |        | <b>Enable VMX outside SMX operation (R/WL)</b>   |
| 40H              | 64  | MSR_LASTBRANCH_0_FROM_IP | Core   | <b>Last Branch Record 0 From IP (R/W)</b><br>One of eight pairs of last branch record registers on the last branch record stack. The From_IP part of the stack contains pointers to the <b>source instruction</b> . See also: <ul style="list-style-type: none"> <li>Last Branch Record Stack TOS at 1C9H</li> <li>Section 17.5 and record format in Section 17.4.8.1</li> </ul> |
| 41H              | 65  | MSR_LASTBRANCH_1_FROM_IP | Core   | <b>Last Branch Record 1 From IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_FROM_IP.  |

Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures

| Register Address |     | Register Name              | Scope  | Bit Description  |
|------------------|-----|----------------------------|--------|--|
| Hex              | Dec |                            |        |  |
| 42H              | 66  | MSR_LASTBRANCH_2_FROM_IP   | Core   | <b>Last Branch Record 2 From IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_FROM_IP.  |
| 43H              | 67  | MSR_LASTBRANCH_3_FROM_IP   | Core   | <b>Last Branch Record 3 From IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_FROM_IP.  |
| 44H              | 68  | MSR_LASTBRANCH_4_FROM_IP   | Core   | <b>Last Branch Record 4 From IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_FROM_IP.  |
| 45H              | 69  | MSR_LASTBRANCH_5_FROM_IP   | Core   | <b>Last Branch Record 5 From IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_FROM_IP.  |
| 46H              | 70  | MSR_LASTBRANCH_6_FROM_IP   | Core   | <b>Last Branch Record 6 From IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_FROM_IP.  |
| 47H              | 71  | MSR_LASTBRANCH_7_FROM_IP   | Core   | <b>Last Branch Record 7 From IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_FROM_IP.  |
| 60H              | 96  | MSR_LASTBRANCH_0_TO_IP     | Core   | <b>Last Branch Record 0 To IP (R/W)</b><br>One of eight pairs of last branch record registers on the last branch record stack. The To_IP part of the stack contains pointers to the destination instruction.                                   |
| 61H              | 97  | MSR_LASTBRANCH_1_TO_IP     | Core   | <b>Last Branch Record 1 To IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_TO_IP.  |
| 62H              | 98  | MSR_LASTBRANCH_2_TO_IP     | Core   | <b>Last Branch Record 2 To IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_TO_IP.  |
| 63H              | 99  | MSR_LASTBRANCH_3_TO_IP     | Core   | <b>Last Branch Record 3 To IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_TO_IP.  |
| 64H              | 100 | MSR_LASTBRANCH_4_TO_IP     | Core   | <b>Last Branch Record 4 To IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_TO_IP.  |
| 65H              | 101 | MSR_LASTBRANCH_5_TO_IP     | Core   | <b>Last Branch Record 5 To IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_TO_IP.  |
| 66H              | 102 | MSR_LASTBRANCH_6_TO_IP     | Core   | <b>Last Branch Record 6 To IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_TO_IP.  |
| 67H              | 103 | MSR_LASTBRANCH_7_TO_IP     | Core   | <b>Last Branch Record 7 To IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_TO_IP.  |
| E2H              | 226 | MSR_PKG_CST_CONFIG_CONTROL | Module | <b>C-State Configuration Control (R/W)</b><br>Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.<br>See <a href="http://biosbits.org">http://biosbits.org</a> . |

Table 2-7. MSRs Common to the Silvermont and Airmont Microarchitectures

| Register Address |     | Register Name    | Scope  | Bit Description  |
|------------------|-----|------------------|--------|--|
| Hex              | Dec |                  |        |  |
|                  |     | 2:0              |        | <b>Package C-State Limit (R/W)</b><br>Specifies the lowest processor-specific C-state code name (consuming the least power), for the package. The default is set as factory-configured package C-state limit.<br>The following C-state code name encodings are supported:<br>000b: C0 (no package C-state support)<br>001b: C1 (Behavior is the same as 000b)<br>100b: C4<br>110b: C6<br>111b: C7 (Silvermont only). |
|                  |     | 9:3              |        | Reserved.  |
|                  |     | 10               |        | <b>I/O MWAIT Redirection Enable (R/W)</b><br>When set, will map IO_read instructions sent to IO register specified by MSR_PMG_IO_CAPTURE_BASE to MWAIT instructions  |
|                  |     | 14:11            |        | Reserved.  |
|                  |     | 15               |        | <b>CFG Lock (R/WO)</b><br>When set, lock bits 15:0 of this register until next reset.  |
|                  |     | 63:16            |        | Reserved.  |
| 11EH             | 281 | MSR_BBL_CR_CTL3  | Module | Control register 3.<br>Used to configure the L2 Cache.   |
|                  |     | 0                |        | <b>L2 Hardware Enabled (RO)</b><br>1 = If the L2 is hardware-enabled<br>0 = Indicates if the L2 is hardware-disabled   |
|                  |     | 7:1              |        | Reserved.  |
|                  |     | 8                |        | <b>L2 Enabled. (R/W)</b><br>1 = L2 cache has been initialized<br>0 = Disabled (default)<br>Until this bit is set the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.  |
|                  |     | 22:9             |        | Reserved.  |

## 2.4.1 MSRs with Model-Specific Behavior in the Silvermont Microarchitecture

Table 2-8 lists model-specific registers (MSRs) that are specific to Intel® Atom™ processor E3000 Series (CPUID signature with DisplayFamily\_DisplayModel of 06\_37H) and Intel Atom processors (CPUID signatures with DisplayFamily\_DisplayModel of 06\_4AH, 06\_5AH, 06\_5DH).

**Table 2-8. Specific MSRs Supported by Intel® Atom™ Processors with CPUID Signatures 06\_37H, 06\_4AH, 06\_5AH, 06\_5DH**

| Register Address |      | Register Name         | Scope   | Bit Description   |
|------------------|------|-----------------------|---------|---|
| Hex              | Dec  |                       |         |   |
| 606H             | 1542 | MSR_RAPL_POWER_UNIT   | Package | <b>Unit Multipliers used in RAPL Interfaces (R/O)</b><br>See Section 14.9.1, “RAPL Interfaces.”   |
|                  |      | 3:0                   |         | Power Units.<br>Power related information (in milliWatts) is based on the multiplier, $2^{\text{PU}}$ ; where PU is an unsigned integer represented by bits 3:0. Default value is 0101b, indicating power unit is in 32 milliWatts increment.                 |
|                  |      | 7:4                   |         | Reserved  |
|                  |      | 12:8                  |         | Energy Status Units.<br>Energy related information (in microJoules) is based on the multiplier, $2^{\text{ESU}}$ ; where ESU is an unsigned integer represented by bits 12:8. Default value is 00101b, indicating energy unit is in 32 microJoules increment. |
|                  |      | 15:13                 |         | Reserved  |
|                  |      | 19:16                 |         | Time Unit.<br>The value is 0000b, indicating time unit is in one second.  |
|                  |      | 63:20                 |         | Reserved  |
| 610H             | 1552 | MSR_PKG_POWER_LIMIT   | Package | <b>PKG RAPL Power Limit Control (R/W)</b>   |
|                  |      | 14:0                  |         | Package Power Limit #1. (R/W)<br>See Section 14.9.3, “Package RAPL Domain.” and MSR_RAPL_POWER_UNIT in Table 2-8.   |
|                  |      | 15                    |         | Enable Power Limit #1. (R/W)<br>See Section 14.9.3, “Package RAPL Domain.”  |
|                  |      | 16                    |         | Package Clamping Limitation #1. (R/W)<br>See Section 14.9.3, “Package RAPL Domain.”   |
|                  |      | 23:17                 |         | Time Window for Power Limit #1. (R/W)<br>in unit of second. If 0 is specified in bits [23:17], defaults to 1 second window.   |
|                  |      | 63:24                 |         | Reserved  |
| 611H             | 1553 | MSR_PKG_ENERGY_STATUS | Package | <b>PKG Energy Status (R/O)</b><br>See Section 14.9.3, “Package RAPL Domain.” and MSR_RAPL_POWER_UNIT in Table 2-8   |
| 639H             | 1593 | MSR_PP0_ENERGY_STATUS | Package | <b>PP0 Energy Status (R/O)</b><br>See Section 14.9.4, “PP0/PP1 RAPL Domains.” and MSR_RAPL_POWER_UNIT in Table 2-8  |
| CDH              | 205  | MSR_FSB_FREQ          | Module  | <b>Scaleable Bus Speed(R0)</b><br>This field indicates the intended scaleable bus clock speed for processors based on Silvermont microarchitecture.   |

**Table 2-8. Specific MSRs Supported by Intel® Atom™ Processors with CPUID Signatures 06\_37H, 06\_4AH, 06\_5AH, 06\_5DH**

| Register Address |     | Register Name | Scope | Bit Description   |
|------------------|-----|---------------|-------|---|
| Hex              | Dec |               |       |   |
|                  |     | 2:0           |       | <ul style="list-style-type: none"> <li>100B: 080.0 MHz</li> <li>000B: 083.3 MHz</li> <li>001B: 100.0 MHz</li> <li>010B: 133.3 MHz</li> <li>011B: 116.7 MHz</li> </ul> |
|                  |     | 63:3          |       | Reserved.   |

Table 2-9 lists model-specific registers (MSRs) that are specific to Intel® Atom™ processor E3000 Series (CPUID signature with DisplayFamily\_DisplayModel of 06\_37H).

**Table 2-9. Specific MSRs Supported by Intel® Atom™ Processor E3000 Series with CPUID Signature 06\_37H**

| Register Address |      | Register Name                  | Scope   | Bit Description   |
|------------------|------|--------------------------------|---------|---|
| Hex              | Dec  |                                |         |   |
| 668H             | 1640 | MSR_CC6_DEMOTION_POLICY_CONFIG | Package | <b>Core C6 demotion policy config MSR</b>   |
|                  |      | 63:0                           |         | Controls per-core C6 demotion policy. Writing a value of 0 disables core level HW demotion policy.  |
| 669H             | 1641 | MSR_MC6_DEMOTION_POLICY_CONFIG | Package | <b>Module C6 demotion policy config MSR</b>   |
|                  |      | 63:0                           |         | Controls module (i.e. two cores sharing the second-level cache) C6 demotion policy. Writing a value of 0 disables module level HW demotion policy.                            |
| 664H             | 1636 | MSR_MC6_RESIDENCY_COUNTER      | Module  | <b>Module C6 Residency Counter (R/O)</b><br>Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. |
|                  |      | 63:0                           |         | Time that this module is in module-specific C6 states since last reset. Counts at 1 Mhz frequency.  |

Table 2-10 lists model-specific registers (MSRs) that are specific to Intel® Atom™ processor C2000 Series (CPUID signature with DisplayFamily\_DisplayModel of 06\_4DH).

**Table 2-10. Specific MSRs Supported by Intel® Atom™ Processor C2000 Series with CPUID Signature 06\_4DH**

| Register Address |     | Register Name            | Scope | Bit Description   |
|------------------|-----|--------------------------|-------|---|
| Hex              | Dec |                          |       |   |
| 1A4H             | 420 | MSR_MISC_FEATURE_CONTROL |       | <b>Miscellaneous Feature Control (R/W)</b>  |
|                  |     | 0                        | Core  | <b>L2 Hardware Prefetcher Disable (R/W)</b><br>If 1, disables the L2 hardware prefetcher, which fetches additional lines of code or data into the L2 cache. |
|                  |     | 1                        |       | <b>Reserved</b>   |

**Table 2-10. Specific MSRs Supported by Intel® Atom™ Processor C2000 Series (Contd.)with CPUID Signature**

## 2.4.2 MSRs In Intel Atom Processors Based on Airmont Microarchitecture

Intel Atom processor X7-Z8000 and X5-Z8000 series are based on the Airmont microarchitecture. These processors support MSRs listed in Table 2-6, Table 2-7, Table 2-8, and Table 2-11. These processors have a CPUID signature with DisplayFamily\_DisplayModel including 06\_4CH; see Table 2-1.

**Table 2-11. MSRs in Intel Atom Processors Based on the Airmont Microarchitecture**

| Address |     | Register Name              | Scope  | Bit Description   |
|---------|-----|----------------------------|--------|---|
| Hex     | Dec |                            |        |   |
| CDH     | 205 | MSR_FSB_FREQ               | Module | <b>Scaleable Bus Speed(R0)</b><br>This field indicates the intended scaleable bus clock speed for processors based on Airmont microarchitecture:  |

## 2.5 MSRS IN INTEL ATOM PROCESSORS BASED ON GOLDMONT MICROARCHITECTURE

Intel Atom processors based on the Goldmont microarchitecture support MSRs listed in Table 2-6 and Table 2-12. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_5CH; see Table 2-1.

In the Goldmont microarchitecture, the scope column indicates the following: "Core" means each processor core has a separate MSR, or a bit field not shared with another processor core. "Module" means the MSR or the bit field is shared by a pair of processor cores in the physical package. "Package" means all processor cores in the physical package share the same MSR or bit interface.

**Table 2-12. MSRs in Intel Atom Processors Based on the Goldmont Microarchitecture**

| Address |     | Register Name        | Scope  | Bit Description  |

## 2.6 MSRS IN INTEL ATOM PROCESSORS BASED ON GOLDMONT PLUS MICROARCHITECTURE

Intel Atom processors based on the Goldmont Plus microarchitecture support MSRs listed in Table 2-6, Table 2-12 and Table 2-13. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_7AH; see Table 2-1. For an MSR listed in Table 2-13 that also appears in the model-specific tables of prior generations, Table 2-13 supercede prior generation tables.

In the Goldmont Plus microarchitecture, the scope column indicates the following: “Core” means each processor core has a separate MSR, or a bit field not shared with another processor core. “Module” means the MSR or the bit field is shared by a pair of processor cores in the physical package. “Package” means all processor cores in the physical package share the same MSR or bit interface.

**Table 2-13. MSRs in Intel Atom Processors Based on the Goldmont Plus Microarchitecture**

| Address |     | Register Name        | Scope | Bit Description  |
|---------|-----|----------------------|-------|--|
| Hex     | Dec |                      |       |  |

## 2.7 MSRS IN THE INTEL® MICROARCHITECTURE CODE NAME NEHALEM

Table 2-14 lists model-specific registers (MSRs) that are common for Intel® microarchitecture code name Nehalem. These include Intel Core i7 and i5 processor family. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_1AH, 06\_1EH, 06\_1FH, 06\_2EH, see Table 2-1. Additional MSRs specific to 06\_1AH, 06\_1EH, 06\_1FH are listed in Table 2-15. Some MSRs listed in these tables are used by BIOS. More information about these MSR can be found at <http://biosbits.org>.

The column “Scope” represents the package/core/thread scope of individual bit field of an MSR. “Thread” means this bit field must be programmed on each logical processor independently. “Core” means the bit field must be programmed on each processor core independently, logical processors in the same core will be affected by change of this bit on the other logical processor in the same core. “Package” means the bit field must be programmed once for each physical package. Change of a bit filed with a package scope will affect all logical processors in that physical package.

**Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem**

| Register Address |     | Register Name            | Scope   | Bit Description   |
|------------------|-----|--------------------------|---------|---|
| Hex              | Dec |                          |         |   |
| 0H               | 0   | IA32_P5_MC_ADDR          | Thread  | See Section 2.22, “MSRs in Pentium Processors.”                                 |
| 1H               | 1   | IA32_P5_MC_TYPE          | Thread  | See Section 2.22, “MSRs in Pentium Processors.”                                 |
| 6H               | 6   | IA32_MONITOR_FILTER_SIZE | Thread  | See Section 8.10.5, “Monitor/Mwait Address Range Determination,” and Table 2-2. |
| 10H              | 16  | IA32_TIME_STAMP_COUNTER  | Thread  | See Section 17.17, “Time-Stamp Counter,” and see Table 2-2.                     |

Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)

| Register Address |      | Register Name   | Scope   | Bit Description   |
|------------------|------|-----------------|---------|---|
| Hex              | Dec  |                 |         |   |
| 406H             | 1030 | IA32_MC1_ADDR   | Package | See Section 15.3.2.3, “IA32_MCi_ADDR MSRs.”<br>The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC1_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 407H             | 1031 | IA32_MC1_MISC   | Package | See Section 15.3.2.4, “IA32_MCi_MISC MSRs.”   |
| 408H             | 1032 | IA32_MC2_CTL    | Core    | See Section 15.3.2.1, “IA32_MCi_CTL MSRs.”  |
| 409H             | 1033 | IA32_MC2_STATUS | Core    | See Section 15.3.2.2, “IA32_MCi_STATUS MSRs.”   |
| 40AH             | 1034 | IA32_MC2_ADDR   | Core    | See Section 15.3.2.3, “IA32_MCi_ADDR MSRs.”<br>The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 40BH             | 1035 | IA32_MC2_MISC   | Core    | See Section 15.3.2.4, “IA32_MCi_MISC MSRs.”   |
| 40CH             | 1036 | IA32_MC3_CTL    | Core    | See Section 15.3.2.1, “IA32_MCi_CTL MSRs.”  |
| 40DH             | 1037 | IA32_MC3_STATUS | Core    | See Section 15.3.2.2, “IA32_MCi_STATUS MSRs.”   |
| 40EH             | 1038 | IA32_MC3_ADDR   | Core    | See Section 15.3.2.3, “IA32_MCi_ADDR MSRs.”<br>The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.   |
| 40FH             | 1039 | IA32_MC3_MISC   | Core    | See Section 15.3.2.4, “IA32_MCi_MISC MSRs.”   |
| 410H             | 1040 | IA32_MC4_CTL    | Core    | See Section 15.3.2.1, “IA32_MCi_CTL MSRs.”  |
| 411H             | 1041 | IA32_MC4_STATUS | Core    | See Section 15.3.2.2, “IA32_MCi_STATUS MSRs.”   |
| 412H             | 1042 | IA32_MC4_ADDR   | Core    | See Section 15.3.2.3, “IA32_MCi_ADDR MSRs.”<br>The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC3_STATUS register is clear.<br>When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.   |
| 413H             | 1043 | IA32_MC4_MISC   | Core    | See Section 15.3.2.4, “IA32_MCi_MISC MSRs.”   |
| 414H             | 1044 | IA32_MC5_CTL    | Core    | See Section 15.3.2.1, “IA32_MCi_CTL MSRs.”  |
| 415H             | 1045 | IA32_MC5_STATUS | Core    | See Section 15.3.2.2, “IA32_MCi_STATUS MSRs.”   |
| 416H             | 1046 | IA32_MC5_ADDR   | Core    | See Section 15.3.2.3, “IA32_MCi_ADDR MSRs.”   |
| 417H             | 1047 | IA32_MC5_MISC   | Core    | See Section 15.3.2.4, “IA32_MCi_MISC MSRs.”   |
| 418H             | 1048 | IA32_MC6_CTL    | Package | See Section 15.3.2.1, “IA32_MCi_CTL MSRs.”  |
| 419H             | 1049 | IA32_MC6_STATUS | Package | See Section 15.3.2.2, “IA32_MCi_STATUS MSRs,” and Chapter 16.   |
| 41AH             | 1050 | IA32_MC6_ADDR   | Package | See Section 15.3.2.3, “IA32_MCi_ADDR MSRs.”   |

**Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)**

| Register Address |      | Register Name          | Scope   | Bit Description   |
|------------------|------|------------------------|---------|---|
| Hex              | Dec  |                        |         |   |
| 41BH             | 1051 | IA32_MC6_MISC          | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."   |
| 41CH             | 1052 | IA32_MC7_CTL           | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."  |
| 41DH             | 1053 | IA32_MC7_STATUS        | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs," and Chapter 16.   |
| 41EH             | 1054 | IA32_MC7_ADDR          | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."   |
| 41FH             | 1055 | IA32_MC7_MISC          | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."   |
| 420H             | 1056 | IA32_MC8_CTL           | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."  |
| 421H             | 1057 | IA32_MC8_STATUS        | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs," and Chapter 16.   |
| 422H             | 1058 | IA32_MC8_ADDR          | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."   |
| 423H             | 1059 | IA32_MC8_MISC          | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."   |
| 480H             | 1152 | IA32_VMX_BASIC         | Thread  | <b>Reporting Register of Basic VMX Capabilities (R/O)</b><br>See Table 2-2.<br>See Appendix A.1, "Basic VMX Information."                     |
| 481H             | 1153 | IA32_VMX_PINBASED_CTL  | Thread  | <b>Capability Reporting Register of Pin-based VM-execution Controls (R/O)</b><br>See Table 2-2.<br>See Appendix A.3, "VM-Execution Controls." |
| 482H             | 1154 | IA32_VMX_PROCBASED_CTL | Thread  | <b>Capability Reporting Register of Primary Processor-based VM-execution Controls (R/O)</b><br>See Appendix A.3, "VM-Execution Controls."     |
| 483H             | 1155 | IA32_VMX_EXIT_CTL      | Thread  | <b>Capability Reporting Register of VM-exit Controls (R/O)</b><br>See Table 2-2.<br>See Appendix A.4, "VM-Exit Controls."                     |
| 484H             | 1156 | IA32_VMX_ENTRY_CTL     | Thread  | <b>Capability Reporting Register of VM-entry Controls (R/O)</b><br>See Table 2-2.<br>See Appendix A.5, "VM-Entry Controls."                   |
| 485H             | 1157 | IA32_VMX_MISC          | Thread  | <b>Reporting Register of Miscellaneous VMX Capabilities (R/O)</b><br>See Table 2-2.<br>See Appendix A.6, "Miscellaneous Data."                |
| 486H             | 1158 | IA32_VMX_CR0_FIXED0    | Thread  | <b>Capability Reporting Register of CR0 Bits Fixed to 0 (R/O)</b><br>See Table 2-2.<br>See Appendix A.7, "VMX-Fixed Bits in CR0."             |
| 487H             | 1159 | IA32_VMX_CR0_FIXED1    | Thread  | <b>Capability Reporting Register of CR0 Bits Fixed to 1 (R/O)</b><br>See Table 2-2.<br>See Appendix A.7, "VMX-Fixed Bits in CR0."             |
| 488H             | 1160 | IA32_VMX_CR4_FIXED0    | Thread  | <b>Capability Reporting Register of CR4 Bits Fixed to 0 (R/O)</b><br>See Table 2-2.<br>See Appendix A.8, "VMX-Fixed Bits in CR4."             |

**Table 2-14. MSRs in Processors Based on Intel® Microarchitecture Code Name Nehalem (Contd.)**

| Register Address |      | Register Name             | Scope  | Bit Description   |
|------------------|------|---------------------------|--------|---|
| Hex              | Dec  |                           |        |   |
| 489H             | 1161 | IA32_VMX_CR4_FIXED1       | Thread | <b>Capability Reporting Register of CR4 Bits Fixed to 1 (R/O)</b><br>See Table 2-2.<br>See Appendix A.8, “VMX-Fixed Bits in CR4.”   |
| 48AH             | 1162 | IA32_VMX_VMCS_ENUM        | Thread | <b>Capability Reporting Register of VMCS Field Enumeration (R/O).</b><br>See Table 2-2.<br>See Appendix A.9, “VMCS Enumeration.”  |
| 48BH             | 1163 | IA32_VMX_PROCBASED_CTLDS2 | Thread | <b>Capability Reporting Register of Secondary Processor-based VM-execution Controls (R/O)</b><br>See Appendix A.3, “VM-Execution Controls.”   |
| 600H             | 1536 | IA32_DS_AREA              | Thread | <b>DS Save Area (R/W)</b><br>See Table 2-2.<br>See Section 18.6.3.4, “Debug Store (DS) Mechanism.”  |
| 680H             | 1664 | MSR_LASTBRANCH_0_FROM_IP  | Thread | <b>Last Branch Record 0 From IP (R/W)</b><br>One of sixteen pairs of last branch record registers on the last branch record stack. The From_IP part of the stack contains pointers to the <b>source instruction</b> . See also:<br><ul style="list-style-type: none"> <li>Last Branch Record Stack TOS at 1C9H</li> <li>Section 17.9.1 and record format in Section 17.4.8.1</li> </ul> |
| 681H             | 1665 | MSR_LASTBRANCH_1_FROM_IP  | Thread | <b>Last Branch Record 1 From IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_FROM_IP.   |
| 682H             | 1666 | MSR_LASTBRANCH_2_FROM_IP  | Thread | <b>Last Branch Record 2 From IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_FROM_IP.   |
| 683H             | 1667 | MSR_LASTBRANCH_3_FROM_IP  | Thread | <b>Last Branch Record 3 From IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_FROM_IP.   |
| 684H             | 1668 | MSR_LASTBRANCH_4_FROM_IP  | Thread | <b>Last Branch Record 4 From IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_FROM_IP.   |
| 685H             | 1669 | MSR_LASTBRANCH_5_FROM_IP  | Thread | <b>Last Branch Record 5 From IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_FROM_IP.   |
| 686H             | 1670 | MSR_LASTBRANCH_6_FROM_IP  | Thread | <b>Last Branch Record 6 From IP (R/W)</b><br>See description of MSR_LASTBRANCH_0_FROM_IP.   |

| C000_0101H       |      | IA32_GS_BASE            | Thread | <b>Map of BASE Address of GS (R/W)</b><br>See Table 2-2.   |
| C000_0102H       |      | IA32_KERNEL_GS_BASE     | Thread | <b>Swap Target of BASE Address of GS (R/W)</b> See Table 2-2.  |
| C000_0103H       |      | IA32_TSC_AUX            | Thread | <b>AUXILIARY TSC Signature. (R/W)</b> See Table 2-2 and Section 17.17.2, "IA32_TSC_AUX Register and RDTSCP Support." |

## 2.7.1 Additional MSRs in the Intel® Xeon® Processor 5500 and 3400 Series

Intel Xeon Processor 5500 and 3400 series support additional model-specific registers listed in Table 2-15. These MSRs also apply to Intel Core i7 and i5 processor family CPUID signature with DisplayFamily\_DisplayModel of 06\_1AH, 06\_1EH and 06\_1FH, see Table 2-1.

Table 2-15. Additional MSRs in Intel® Xeon® Processor 5500 and 3400 Series

| Register Address |     | Register Name                   | Scope   | Bit Description  |
|------------------|-----|---------------------------------|---------|--|
| Hex              | Dec |                                 |         |  |
| 1ADH             | 429 | MSR_TURBO_RATIO_LIMIT           | Package | Actual maximum turbo frequency is multiplied by 133.33MHz. (not available to model 06_2EH)       |
|                  |     | 7:0                             |         | <b>Maximum Turbo Ratio Limit 1C (R/O)</b><br>Maximum Turbo mode ratio limit with 1 core active.  |
|                  |     | 15:8                            |         | <b>Maximum Turbo Ratio Limit 2C (R/O)</b><br>Maximum Turbo mode ratio limit with 2 cores active. |
|                  |     | 23:16                           |         | <b>Maximum Turbo Ratio Limit 3C (R/O)</b><br>Maximum Turbo mode ratio limit with 3 cores active. |
|                  |     | 31:24                           |         | <b>Maximum Turbo Ratio Limit 4C (R/O)</b><br>Maximum Turbo mode ratio limit with 4 cores active. |
|                  |     | 63:32                           |         | Reserved.  |
| 301H             | 769 | MSR_GQ_SNOOP_MESF               | Package |  |
|                  |     | 0                               |         | <b>From M to S (R/W)</b>   |
|                  |     | 1                               |         | <b>From E to S (R/W)</b>   |
|                  |     | 2                               |         | <b>From S to S (R/W)</b>   |
|                  |     | 3                               |         | <b>From F to S (R/W)</b>   |
|                  |     | 4                               |         | <b>From M to I (R/W)</b>   |
|                  |     | 5                               |         | <b>From E to I (R/W)</b>   |
|                  |     | 6                               |         | <b>From S to I (R/W)</b>   |
|                  |     | 7                               |         | <b>From F to I (R/W)</b>   |
|                  |     | 63:8                            |         | Reserved.  |
| 391H             | 913 | MSR_UNCORE_PERF_GLOBAL_CTRL     | Package | See Section 18.3.1.2.1, "Uncore Performance Monitoring Management Facility."                     |
| 392H             | 914 | MSR_UNCORE_PERF_GLOBAL_STATUS   | Package | See Section 18.3.1.2.1, "Uncore Performance Monitoring Management Facility."                     |

## 2.7.2 Additional MSRs in the Intel® Xeon® Processor 7500 Series

Intel Xeon Processor 7500 series support MSRs listed in Table 2-14 (except MSR address 1ADH) and additional model-specific registers listed in Table 2-16. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_2EH.

**Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series**

| Register Address |     | Register Name         | Scope   | Bit Description  |
|------------------|-----|-----------------------|---------|--|
| Hex              | Dec |                       |         |  |
| 1ADH             | 429 | MSR_TURBO_RATIO_LIMIT | Package | <b>Reserved</b><br>Attempt to read/write will cause #UD. |
| 289H             | 649 | IA32_MC9_CTL2         | Package | See Table 2-2.   |
| 28AH             | 650 | IA32_MC10_CTL2        | Package | See Table 2-2.   |

| 292H             | 658  | IA32_MC18_CTL2           | Package | See Table 2-2.  |
| 293H             | 659  | IA32_MC19_CTL2           | Package | See Table 2-2.  |
| 294H             | 660  | IA32_MC20_CTL2           | Package | See Table 2-2.  |
| 295H             | 661  | IA32_MC21_CTL2           | Package | See Table 2-2.  |
| 394H             | 816  | MSR_W_PMON_FIXED_CTR     | Package | Uncore W-box perfmon fixed counter                            |
| 395H             | 817  | MSR_W_PMON_FIXED_CTR_CTL | Package | Uncore U-box perfmon fixed counter control MSR                |
| 424H             | 1060 | IA32_MC9_CTL             | Package | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                    |
| 425H             | 1061 | IA32_MC9_STATUS          | Package | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs," and Chapter 16. |
| 426H             | 1062 | IA32_MC9_ADDR            | Package | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."                   |
| 427H             | 1063 | IA32_MC9_MISC            | Package | See Section 15.3.2.4, "IA32_MCi_MISC MSRs."                   |
| 428H             | 1064 | IA32_MC10_CTL            | Package | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                    |
| 429H             | 1065 | IA32_MC10_STATUS         | Package | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs," and Chapter 16. |
| 42AH             | 1066 | IA32_MC10_ADDR           | Package | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."                   |
| 42BH             | 1067 | IA32_MC10_MISC           | Package | See Section 15.3.2.4, "IA32_MCi_MISC MSRs."                   |
| 42CH             | 1068 | IA32_MC11_CTL            | Package | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                    |
| 42DH             | 1069 | IA32_MC11_STATUS         | Package | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs," and Chapter 16. |
| 42EH             | 1070 | IA32_MC11_ADDR           | Package | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."                   |
| 42FH             | 1071 | IA32_MC11_MISC           | Package | See Section 15.3.2.4, "IA32_MCi_MISC MSRs."                   |
| 430H             | 1072 | IA32_MC12_CTL            | Package | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                    |
| 431H             | 1073 | IA32_MC12_STATUS         | Package | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs," and Chapter 16. |
| 432H             | 1074 | IA32_MC12_ADDR           | Package | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."                   |
| 433H             | 1075 | IA32_MC12_MISC           | Package | See Section 15.3.2.4, "IA32_MCi_MISC MSRs."                   |
| 434H             | 1076 | IA32_MC13_CTL            | Package | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                    |
| 435H             | 1077 | IA32_MC13_STATUS         | Package | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs," and Chapter 16. |
| 436H             | 1078 | IA32_MC13_ADDR           | Package | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."                   |
| 437H             | 1079 | IA32_MC13_MISC           | Package | See Section 15.3.2.4, "IA32_MCi_MISC MSRs."                   |
| 438H             | 1080 | IA32_MC14_CTL            | Package | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                    |
| 439H             | 1081 | IA32_MC14_STATUS         | Package | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs," and Chapter 16. |
| 43AH             | 1082 | IA32_MC14_ADDR           | Package | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."                   |
| 43BH             | 1083 | IA32_MC14_MISC           | Package | See Section 15.3.2.4, "IA32_MCi_MISC MSRs."                   |
| 43CH             | 1084 | IA32_MC15_CTL            | Package | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                    |

Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series (Contd.)

| Register Address |      | Register Name              | Scope   | Bit Description   |
|------------------|------|----------------------------|---------|---|
| Hex              | Dec  |                            |         |   |
| 43DH             | 1085 | IA32_MC15_STATUS           | Package | See Section 15.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 16. |
| 43EH             | 1086 | IA32_MC15_ADDR             | Package | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."                   |
| 43FH             | 1087 | IA32_MC15_MISC             | Package | See Section 15.3.2.4, "IA32_MCi_MISC MSRs."                   |
| 440H             | 1088 | IA32_MC16_CTL              | Package | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                    |
| 441H             | 1089 | IA32_MC16_STATUS           | Package | See Section 15.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 16. |
| 442H             | 1090 | IA32_MC16_ADDR             | Package | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."                   |
| 443H             | 1091 | IA32_MC16_MISC             | Package | See Section 15.3.2.4, "IA32_MCi_MISC MSRs."                   |
| 444H             | 1092 | IA32_MC17_CTL              | Package | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                    |
| 445H             | 1093 | IA32_MC17_STATUS           | Package | See Section 15.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 16. |
| 446H             | 1094 | IA32_MC17_ADDR             | Package | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."                   |
| 447H             | 1095 | IA32_MC17_MISC             | Package | See Section 15.3.2.4, "IA32_MCi_MISC MSRs."                   |
| 448H             | 1096 | IA32_MC18_CTL              | Package | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                    |
| 449H             | 1097 | IA32_MC18_STATUS           | Package | See Section 15.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 16. |
| 44AH             | 1098 | IA32_MC18_ADDR             | Package | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."                   |
| 44BH             | 1099 | IA32_MC18_MISC             | Package | See Section 15.3.2.4, "IA32_MCi_MISC MSRs."                   |
| 44CH             | 1100 | IA32_MC19_CTL              | Package | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                    |
| 44DH             | 1101 | IA32_MC19_STATUS           | Package | See Section 15.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 16. |
| 44EH             | 1102 | IA32_MC19_ADDR             | Package | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."                   |
| 44FH             | 1103 | IA32_MC19_MISC             | Package | See Section 15.3.2.4, "IA32_MCi_MISC MSRs."                   |
| 450H             | 1104 | IA32_MC20_CTL              | Package | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                    |
| 451H             | 1105 | IA32_MC20_STATUS           | Package | See Section 15.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 16. |
| 452H             | 1106 | IA32_MC20_ADDR             | Package | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."                   |
| 453H             | 1107 | IA32_MC20_MISC             | Package | See Section 15.3.2.4, "IA32_MCi_MISC MSRs."                   |
| 454H             | 1108 | IA32_MC21_CTL              | Package | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."                    |
| 455H             | 1109 | IA32_MC21_STATUS           | Package | See Section 15.3.2.2, "IA32_MCi_STATUS MSRS," and Chapter 16. |
| 456H             | 1110 | IA32_MC21_ADDR             | Package | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."                   |
| 457H             | 1111 | IA32_MC21_MISC             | Package | See Section 15.3.2.4, "IA32_MCi_MISC MSRs."                   |
| C00H             | 3072 | MSR_U_PMON_GLOBAL_CTRL     | Package | Uncore U-box perfmon global control MSR.                      |
| C01H             | 3073 | MSR_U_PMON_GLOBAL_STATUS   | Package | Uncore U-box perfmon global status MSR.                       |
| C02H             | 3074 | MSR_U_PMON_GLOBAL_OVF_CTRL | Package | Uncore U-box perfmon global overflow control MSR.             |
| C10H             | 3088 | MSR_U_PMON_EVNT_SEL        | Package | Uncore U-box perfmon event select MSR.                        |
| C11H             | 3089 | MSR_U_PMON_CTR             | Package | Uncore U-box perfmon counter MSR.                             |
| C20H             | 3104 | MSR_B0_PMON_BOX_CTRL       | Package | Uncore B-box 0 perfmon local box control MSR.                 |

Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series (Contd.)

| Register Address |      | Register Name            | Scope   | Bit Description  |
|------------------|------|--------------------------|---------|--|
| Hex              | Dec  |                          |         |  |
| C21H             | 3105 | MSR_B0_PMON_BOX_STATUS   | Package | Uncore B-box 0 perfmon local box status MSR.           |
| C22H             | 3106 | MSR_B0_PMON_BOX_OVF_CTRL | Package | Uncore B-box 0 perfmon local box overflow control MSR. |
| C30H             | 3120 | MSR_B0_PMON_EVNT_SELO    | Package | Uncore B-box 0 perfmon event select MSR.               |
| C31H             | 3121 | MSR_B0_PMON_CTR0         | Package | Uncore B-box 0 perfmon counter MSR.                    |
| C32H             | 3122 | MSR_B0_PMON_EVNT_SEL1    | Package | Uncore B-box 0 perfmon event select MSR.               |
| C33H             | 3123 | MSR_B0_PMON_CTR1         | Package | Uncore B-box 0 perfmon counter MSR.                    |
| C34H             | 3124 | MSR_B0_PMON_EVNT_SEL2    | Package | Uncore B-box 0 perfmon event select MSR.               |
| C35H             | 3125 | MSR_B0_PMON_CTR2         | Package | Uncore B-box 0 perfmon counter MSR.                    |
| C36H             | 3126 | MSR_B0_PMON_EVNT_SEL3    | Package | Uncore B-box 0 perfmon event select MSR.               |
| C37H             | 3127 | MSR_B0_PMON_CTR3         | Package | Uncore B-box 0 perfmon counter MSR.                    |
| C40H             | 3136 | MSR_S0_PMON_BOX_CTRL     | Package | Uncore S-box 0 perfmon local box control MSR.          |
| C41H             | 3137 | MSR_S0_PMON_BOX_STATUS   | Package | Uncore S-box 0 perfmon local box status MSR.           |
| C42H             | 3138 | MSR_S0_PMON_BOX_OVF_CTRL | Package | Uncore S-box 0 perfmon local box overflow control MSR. |
| C50H             | 3152 | MSR_S0_PMON_EVNT_SELO    | Package | Uncore S-box 0 perfmon event select MSR.               |
| C51H             | 3153 | MSR_S0_PMON_CTR0         | Package | Uncore S-box 0 perfmon counter MSR.                    |
| C52H             | 3154 | MSR_S0_PMON_EVNT_SEL1    | Package | Uncore S-box 0 perfmon event select MSR.               |
| C53H             | 3155 | MSR_S0_PMON_CTR1         | Package | Uncore S-box 0 perfmon counter MSR.                    |
| C54H             | 3156 | MSR_S0_PMON_EVNT_SEL2    | Package | Uncore S-box 0 perfmon event select MSR.               |
| C55H             | 3157 | MSR_S0_PMON_CTR2         | Package | Uncore S-box 0 perfmon counter MSR.                    |
| C56H             | 3158 | MSR_S0_PMON_EVNT_SEL3    | Package | Uncore S-box 0 perfmon event select MSR.               |
| C57H             | 3159 | MSR_S0_PMON_CTR3         | Package | Uncore S-box 0 perfmon counter MSR.                    |
| C60H             | 3168 | MSR_B1_PMON_BOX_CTRL     | Package | Uncore B-box 1 perfmon local box control MSR.          |
| C61H             | 3169 | MSR_B1_PMON_BOX_STATUS   | Package | Uncore B-box 1 perfmon local box status MSR.           |
| C62H             | 3170 | MSR_B1_PMON_BOX_OVF_CTRL | Package | Uncore B-box 1 perfmon local box overflow control MSR. |

Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series (Contd.)

| Register Address |      | Register Name            | Scope   | Bit Description  |
|------------------|------|--------------------------|---------|--|
| Hex              | Dec  |                          |         |  |
| C70H             | 3184 | MSR_B1_PMON_EVNT_SELO    | Package | Uncore B-box 1 perfmon event select MSR.               |
| C71H             | 3185 | MSR_B1_PMON_CTRL0        | Package | Uncore B-box 1 perfmon counter MSR.                    |
| C72H             | 3186 | MSR_B1_PMON_EVNT_SEL1    | Package | Uncore B-box 1 perfmon event select MSR.               |
| C73H             | 3187 | MSR_B1_PMON_CTRL1        | Package | Uncore B-box 1 perfmon counter MSR.                    |
| C74H             | 3188 | MSR_B1_PMON_EVNT_SEL2    | Package | Uncore B-box 1 perfmon event select MSR.               |
| C75H             | 3189 | MSR_B1_PMON_CTRL2        | Package | Uncore B-box 1 perfmon counter MSR.                    |
| C76H             | 3190 | MSR_B1_PMON_EVNT_SEL3    | Package | Uncore B-box 1vperfmon event select MSR.               |
| C77H             | 3191 | MSR_B1_PMON_CTRL3        | Package | Uncore B-box 1 perfmon counter MSR.                    |
| C80H             | 3120 | MSR_W_PMON_BOX_CTRL      | Package | Uncore W-box perfmon local box control MSR.            |
| C81H             | 3121 | MSR_W_PMON_BOX_STATUS    | Package | Uncore W-box perfmon local box status MSR.             |
| C82H             | 3122 | MSR_W_PMON_BOX_OVF_CTRL  | Package | Uncore W-box perfmon local box overflow control MSR.   |
| C90H             | 3136 | MSR_W_PMON_EVNT_SELO     | Package | Uncore W-box perfmon event select MSR.                 |
| C91H             | 3137 | MSR_W_PMON_CTRL0         | Package | Uncore W-box perfmon counter MSR.                      |
| C92H             | 3138 | MSR_W_PMON_EVNT_SEL1     | Package | Uncore W-box perfmon event select MSR.                 |
| C93H             | 3139 | MSR_W_PMON_CTRL1         | Package | Uncore W-box perfmon counter MSR.                      |
| C94H             | 3140 | MSR_W_PMON_EVNT_SEL2     | Package | Uncore W-box perfmon event select MSR.                 |
| C95H             | 3141 | MSR_W_PMON_CTRL2         | Package | Uncore W-box perfmon counter MSR.                      |
| C96H             | 3142 | MSR_W_PMON_EVNT_SEL3     | Package | Uncore W-box perfmon event select MSR.                 |
| C97H             | 3143 | MSR_W_PMON_CTRL3         | Package | Uncore W-box perfmon counter MSR.                      |
| CA0H             | 3232 | MSR_M0_PMON_BOX_CTRL     | Package | Uncore M-box 0 perfmon local box control MSR.          |
| CA1H             | 3233 | MSR_M0_PMON_BOX_STATUS   | Package | Uncore M-box 0 perfmon local box status MSR.           |
| CA2H             | 3234 | MSR_M0_PMON_BOX_OVF_CTRL | Package | Uncore M-box 0 perfmon local box overflow control MSR. |
| CA4H             | 3236 | MSR_M0_PMON_TIMESTAMP    | Package | Uncore M-box 0 perfmon time stamp unit select MSR.     |
| CA5H             | 3237 | MSR_M0_PMON_DSP          | Package | Uncore M-box 0 perfmon DSP unit select MSR.            |
| CA6H             | 3238 | MSR_M0_PMON_ISS          | Package | Uncore M-box 0 perfmon ISS unit select MSR.            |

Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series (Contd.)

| Register Address |      | Register Name            | Scope   | Bit Description  |
|------------------|------|--------------------------|---------|--|
| Hex              | Dec  |                          |         |  |
| CA7H             | 3239 | MSR_M0_PMON_MAP          | Package | Uncore M-box 0 perfmon MAP unit select MSR.            |
| CA8H             | 3240 | MSR_M0_PMON_MSC_THR      | Package | Uncore M-box 0 perfmon MIC THR select MSR.             |
| CA9H             | 3241 | MSR_M0_PMON_PGT          | Package | Uncore M-box 0 perfmon PGT unit select MSR.            |
| CAAH             | 3242 | MSR_M0_PMON_PLD          | Package | Uncore M-box 0 perfmon PLD unit select MSR.            |
| CABH             | 3243 | MSR_M0_PMON_ZDP          | Package | Uncore M-box 0 perfmon ZDP unit select MSR.            |
| CB0H             | 3248 | MSR_M0_PMON_EVNT_SELO    | Package | Uncore M-box 0 perfmon event select MSR.               |
| CB1H             | 3249 | MSR_M0_PMON_CTRL0        | Package | Uncore M-box 0 perfmon counter MSR.                    |
| CB2H             | 3250 | MSR_M0_PMON_EVNT_SEL1    | Package | Uncore M-box 0 perfmon event select MSR.               |
| CB3H             | 3251 | MSR_M0_PMON_CTRL1        | Package | Uncore M-box 0 perfmon counter MSR.                    |
| CB4H             | 3252 | MSR_M0_PMON_EVNT_SEL2    | Package | Uncore M-box 0 perfmon event select MSR.               |
| CB5H             | 3253 | MSR_M0_PMON_CTRL2        | Package | Uncore M-box 0 perfmon counter MSR.                    |
| CB6H             | 3254 | MSR_M0_PMON_EVNT_SEL3    | Package | Uncore M-box 0 perfmon event select MSR.               |
| CB7H             | 3255 | MSR_M0_PMON_CTRL3        | Package | Uncore M-box 0 perfmon counter MSR.                    |
| CB8H             | 3256 | MSR_M0_PMON_EVNT_SEL4    | Package | Uncore M-box 0 perfmon event select MSR.               |
| CB9H             | 3257 | MSR_M0_PMON_CTRL4        | Package | Uncore M-box 0 perfmon counter MSR.                    |
| CBAH             | 3258 | MSR_M0_PMON_EVNT_SEL5    | Package | Uncore M-box 0 perfmon event select MSR.               |
| CBBH             | 3259 | MSR_M0_PMON_CTRL5        | Package | Uncore M-box 0 perfmon counter MSR.                    |
| CC0H             | 3264 | MSR_S1_PMON_BOX_CTRL     | Package | Uncore S-box 1 perfmon local box control MSR.          |
| CC1H             | 3265 | MSR_S1_PMON_BOX_STATUS   | Package | Uncore S-box 1 perfmon local box status MSR.           |
| CC2H             | 3266 | MSR_S1_PMON_BOX_OVF_CTRL | Package | Uncore S-box 1 perfmon local box overflow control MSR. |
| CD0H             | 3280 | MSR_S1_PMON_EVNT_SELO    | Package | Uncore S-box 1 perfmon event select MSR.               |
| CD1H             | 3281 | MSR_S1_PMON_CTRL0        | Package | Uncore S-box 1 perfmon counter MSR.                    |
| CD2H             | 3282 | MSR_S1_PMON_EVNT_SEL1    | Package | Uncore S-box 1 perfmon event select MSR.               |
| CD3H             | 3283 | MSR_S1_PMON_CTRL1        | Package | Uncore S-box 1 perfmon counter MSR.                    |
| CD4H             | 3284 | MSR_S1_PMON_EVNT_SEL2    | Package | Uncore S-box 1 perfmon event select MSR.               |
| CD5H             | 3285 | MSR_S1_PMON_CTRL2        | Package | Uncore S-box 1 perfmon counter MSR.                    |

Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series (Contd.)

| Register Address |      | Register Name            | Scope   | Bit Description  |
|------------------|------|--------------------------|---------|--|
| Hex              | Dec  |                          |         |  |
| CD6H             | 3286 | MSR_S1_PMON_EVNT_SEL3    | Package | Uncore S-box 1 perfmon event select MSR.               |
| CD7H             | 3287 | MSR_S1_PMON_CTR3         | Package | Uncore S-box 1 perfmon counter MSR.                    |
| CE0H             | 3296 | MSR_M1_PMON_BOX_CTRL     | Package | Uncore M-box 1 perfmon local box control MSR.          |
| CE1H             | 3297 | MSR_M1_PMON_BOX_STATUS   | Package | Uncore M-box 1 perfmon local box status MSR.           |
| CE2H             | 3298 | MSR_M1_PMON_BOX_OVF_CTRL | Package | Uncore M-box 1 perfmon local box overflow control MSR. |
| CE4H             | 3300 | MSR_M1_PMON_TIMESTAMP    | Package | Uncore M-box 1 perfmon time stamp unit select MSR.     |
| CE5H             | 3301 | MSR_M1_PMON_DSP          | Package | Uncore M-box 1 perfmon DSP unit select MSR.            |
| CE6H             | 3302 | MSR_M1_PMON_ISS          | Package | Uncore M-box 1 perfmon ISS unit select MSR.            |
| CE7H             | 3303 | MSR_M1_PMON_MAP          | Package | Uncore M-box 1 perfmon MAP unit select MSR.            |
| CE8H             | 3304 | MSR_M1_PMON_MSC_THR      | Package | Uncore M-box 1 perfmon MIC THR select MSR.             |
| CE9H             | 3305 | MSR_M1_PMON_PGT          | Package | Uncore M-box 1 perfmon PGT unit select MSR.            |
| CEAH             | 3306 | MSR_M1_PMON_PLD          | Package | Uncore M-box 1 perfmon PLD unit select MSR.            |
| CEBH             | 3307 | MSR_M1_PMON_ZDP          | Package | Uncore M-box 1 perfmon ZDP unit select MSR.            |
| CF0H             | 3312 | MSR_M1_PMON_EVNT_SELO    | Package | Uncore M-box 1 perfmon event select MSR.               |
| CF1H             | 3313 | MSR_M1_PMON_CTR0         | Package | Uncore M-box 1 perfmon counter MSR.                    |
| CF2H             | 3314 | MSR_M1_PMON_EVNT_SEL1    | Package | Uncore M-box 1 perfmon event select MSR.               |
| CF3H             | 3315 | MSR_M1_PMON_CTR1         | Package | Uncore M-box 1 perfmon counter MSR.                    |
| CF4H             | 3316 | MSR_M1_PMON_EVNT_SEL2    | Package | Uncore M-box 1 perfmon event select MSR.               |
| CF5H             | 3317 | MSR_M1_PMON_CTR2         | Package | Uncore M-box 1 perfmon counter MSR.                    |
| CF6H             | 3318 | MSR_M1_PMON_EVNT_SEL3    | Package | Uncore M-box 1 perfmon event select MSR.               |
| CF7H             | 3319 | MSR_M1_PMON_CTR3         | Package | Uncore M-box 1 perfmon counter MSR.                    |
| CF8H             | 3320 | MSR_M1_PMON_EVNT_SEL4    | Package | Uncore M-box 1 perfmon event select MSR.               |
| CF9H             | 3321 | MSR_M1_PMON_CTR4         | Package | Uncore M-box 1 perfmon counter MSR.                    |
| CFAH             | 3322 | MSR_M1_PMON_EVNT_SEL5    | Package | Uncore M-box 1 perfmon event select MSR.               |
| CFBH             | 3323 | MSR_M1_PMON_CTR5         | Package | Uncore M-box 1 perfmon counter MSR.                    |
| D00H             | 3328 | MSR_C0_PMON_BOX_CTRL     | Package | Uncore C-box 0 perfmon local box control MSR.          |

Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series (Contd.)

| Register Address |      | Register Name            | Scope   | Bit Description  |
|------------------|------|--------------------------|---------|--|
| Hex              | Dec  |                          |         |  |
| D01H             | 3329 | MSR_CO_PMON_BOX_STATUS   | Package | Uncore C-box 0 perfmon local box status MSR.           |
| D02H             | 3330 | MSR_CO_PMON_BOX_OVF_CTRL | Package | Uncore C-box 0 perfmon local box overflow control MSR. |
| D10H             | 3344 | MSR_CO_PMON_EVNT_SELO    | Package | Uncore C-box 0 perfmon event select MSR.               |
| D11H             | 3345 | MSR_CO_PMON_CTR0         | Package | Uncore C-box 0 perfmon counter MSR.                    |
| D12H             | 3346 | MSR_CO_PMON_EVNT_SEL1    | Package | Uncore C-box 0 perfmon event select MSR.               |
| D13H             | 3347 | MSR_CO_PMON_CTR1         | Package | Uncore C-box 0 perfmon counter MSR.                    |
| D14H             | 3348 | MSR_CO_PMON_EVNT_SEL2    | Package | Uncore C-box 0 perfmon event select MSR.               |
| D15H             | 3349 | MSR_CO_PMON_CTR2         | Package | Uncore C-box 0 perfmon counter MSR.                    |
| D16H             | 3350 | MSR_CO_PMON_EVNT_SEL3    | Package | Uncore C-box 0 perfmon event select MSR.               |
| D17H             | 3351 | MSR_CO_PMON_CTR3         | Package | Uncore C-box 0 perfmon counter MSR.                    |
| D18H             | 3352 | MSR_CO_PMON_EVNT_SEL4    | Package | Uncore C-box 0 perfmon event select MSR.               |
| D19H             | 3353 | MSR_CO_PMON_CTR4         | Package | Uncore C-box 0 perfmon counter MSR.                    |
| D1AH             | 3354 | MSR_CO_PMON_EVNT_SEL5    | Package | Uncore C-box 0 perfmon event select MSR.               |
| D1BH             | 3355 | MSR_CO_PMON_CTR5         | Package | Uncore C-box 0 perfmon counter MSR.                    |
| D20H             | 3360 | MSR_C4_PMON_BOX_CTRL     | Package | Uncore C-box 4 perfmon local box control MSR.          |
| D21H             | 3361 | MSR_C4_PMON_BOX_STATUS   | Package | Uncore C-box 4 perfmon local box status MSR.           |
| D22H             | 3362 | MSR_C4_PMON_BOX_OVF_CTRL | Package | Uncore C-box 4 perfmon local box overflow control MSR. |
| D30H             | 3376 | MSR_C4_PMON_EVNT_SELO    | Package | Uncore C-box 4 perfmon event select MSR.               |
| D31H             | 3377 | MSR_C4_PMON_CTR0         | Package | Uncore C-box 4 perfmon counter MSR.                    |
| D32H             | 3378 | MSR_C4_PMON_EVNT_SEL1    | Package | Uncore C-box 4 perfmon event select MSR.               |
| D33H             | 3379 | MSR_C4_PMON_CTR1         | Package | Uncore C-box 4 perfmon counter MSR.                    |
| D34H             | 3380 | MSR_C4_PMON_EVNT_SEL2    | Package | Uncore C-box 4 perfmon event select MSR.               |
| D35H             | 3381 | MSR_C4_PMON_CTR2         | Package | Uncore C-box 4 perfmon counter MSR.                    |
| D36H             | 3382 | MSR_C4_PMON_EVNT_SEL3    | Package | Uncore C-box 4 perfmon event select MSR.               |
| D37H             | 3383 | MSR_C4_PMON_CTR3         | Package | Uncore C-box 4 perfmon counter MSR.                    |

Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series (Contd.)

| Register Address |      | Register Name            | Scope   | Bit Description  |
|------------------|------|--------------------------|---------|--|
| Hex              | Dec  |                          |         |  |
| D38H             | 3384 | MSR_C4_PMON_EVNT_SEL4    | Package | Uncore C-box 4 perfmon event select MSR.               |
| D39H             | 3385 | MSR_C4_PMON_CTR4         | Package | Uncore C-box 4 perfmon counter MSR.                    |
| D3AH             | 3386 | MSR_C4_PMON_EVNT_SEL5    | Package | Uncore C-box 4 perfmon event select MSR.               |
| D3BH             | 3387 | MSR_C4_PMON_CTR5         | Package | Uncore C-box 4 perfmon counter MSR.                    |
| D40H             | 3392 | MSR_C2_PMON_BOX_CTRL     | Package | Uncore C-box 2 perfmon local box control MSR.          |
| D41H             | 3393 | MSR_C2_PMON_BOX_STATUS   | Package | Uncore C-box 2 perfmon local box status MSR.           |
| D42H             | 3394 | MSR_C2_PMON_BOX_OVF_CTRL | Package | Uncore C-box 2 perfmon local box overflow control MSR. |
| D50H             | 3408 | MSR_C2_PMON_EVNT_SELO    | Package | Uncore C-box 2 perfmon event select MSR.               |
| D51H             | 3409 | MSR_C2_PMON_CTR0         | Package | Uncore C-box 2 perfmon counter MSR.                    |
| D52H             | 3410 | MSR_C2_PMON_EVNT_SEL1    | Package | Uncore C-box 2 perfmon event select MSR.               |
| D53H             | 3411 | MSR_C2_PMON_CTR1         | Package | Uncore C-box 2 perfmon counter MSR.                    |
| D54H             | 3412 | MSR_C2_PMON_EVNT_SEL2    | Package | Uncore C-box 2 perfmon event select MSR.               |
| D55H             | 3413 | MSR_C2_PMON_CTR2         | Package | Uncore C-box 2 perfmon counter MSR.                    |
| D56H             | 3414 | MSR_C2_PMON_EVNT_SEL3    | Package | Uncore C-box 2 perfmon event select MSR.               |
| D57H             | 3415 | MSR_C2_PMON_CTR3         | Package | Uncore C-box 2 perfmon counter MSR.                    |
| D58H             | 3416 | MSR_C2_PMON_EVNT_SEL4    | Package | Uncore C-box 2 perfmon event select MSR.               |
| D59H             | 3417 | MSR_C2_PMON_CTR4         | Package | Uncore C-box 2 perfmon counter MSR.                    |
| D5AH             | 3418 | MSR_C2_PMON_EVNT_SEL5    | Package | Uncore C-box 2 perfmon event select MSR.               |
| D5BH             | 3419 | MSR_C2_PMON_CTR5         | Package | Uncore C-box 2 perfmon counter MSR.                    |
| D60H             | 3424 | MSR_C6_PMON_BOX_CTRL     | Package | Uncore C-box 6 perfmon local box control MSR.          |
| D61H             | 3425 | MSR_C6_PMON_BOX_STATUS   | Package | Uncore C-box 6 perfmon local box status MSR.           |
| D62H             | 3426 | MSR_C6_PMON_BOX_OVF_CTRL | Package | Uncore C-box 6 perfmon local box overflow control MSR. |
| D70H             | 3440 | MSR_C6_PMON_EVNT_SELO    | Package | Uncore C-box 6 perfmon event select MSR.               |
| D71H             | 3441 | MSR_C6_PMON_CTR0         | Package | Uncore C-box 6 perfmon counter MSR.                    |

Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series (Contd.)

| Register Address |      | Register Name            | Scope   | Bit Description  |
|------------------|------|--------------------------|---------|--|
| Hex              | Dec  |                          |         |  |
| D72H             | 3442 | MSR_C6_PMON_EVNT_SEL1    | Package | Uncore C-box 6 perfmon event select MSR.               |
| D73H             | 3443 | MSR_C6_PMON_CTR1         | Package | Uncore C-box 6 perfmon counter MSR.                    |
| D74H             | 3444 | MSR_C6_PMON_EVNT_SEL2    | Package | Uncore C-box 6 perfmon event select MSR.               |
| D75H             | 3445 | MSR_C6_PMON_CTR2         | Package | Uncore C-box 6 perfmon counter MSR.                    |
| D76H             | 3446 | MSR_C6_PMON_EVNT_SEL3    | Package | Uncore C-box 6 perfmon event select MSR.               |
| D77H             | 3447 | MSR_C6_PMON_CTR3         | Package | Uncore C-box 6 perfmon counter MSR.                    |
| D78H             | 3448 | MSR_C6_PMON_EVNT_SEL4    | Package | Uncore C-box 6 perfmon event select MSR.               |
| D79H             | 3449 | MSR_C6_PMON_CTR4         | Package | Uncore C-box 6 perfmon counter MSR.                    |
| D7AH             | 3450 | MSR_C6_PMON_EVNT_SEL5    | Package | Uncore C-box 6 perfmon event select MSR.               |
| D7BH             | 3451 | MSR_C6_PMON_CTR5         | Package | Uncore C-box 6 perfmon counter MSR.                    |
| D80H             | 3456 | MSR_C1_PMON_BOX_CTRL     | Package | Uncore C-box 1 perfmon local box control MSR.          |
| D81H             | 3457 | MSR_C1_PMON_BOX_STATUS   | Package | Uncore C-box 1 perfmon local box status MSR.           |
| D82H             | 3458 | MSR_C1_PMON_BOX_OVF_CTRL | Package | Uncore C-box 1 perfmon local box overflow control MSR. |
| D90H             | 3472 | MSR_C1_PMON_EVNT_SEL0    | Package | Uncore C-box 1 perfmon event select MSR.               |
| D91H             | 3473 | MSR_C1_PMON_CTR0         | Package | Uncore C-box 1 perfmon counter MSR.                    |
| D92H             | 3474 | MSR_C1_PMON_EVNT_SEL1    | Package | Uncore C-box 1 perfmon event select MSR.               |
| D93H             | 3475 | MSR_C1_PMON_CTR1         | Package | Uncore C-box 1 perfmon counter MSR.                    |
| D94H             | 3476 | MSR_C1_PMON_EVNT_SEL2    | Package | Uncore C-box 1 perfmon event select MSR.               |
| D95H             | 3477 | MSR_C1_PMON_CTR2         | Package | Uncore C-box 1 perfmon counter MSR.                    |
| D96H             | 3478 | MSR_C1_PMON_EVNT_SEL3    | Package | Uncore C-box 1 perfmon event select MSR.               |
| D97H             | 3479 | MSR_C1_PMON_CTR3         | Package | Uncore C-box 1 perfmon counter MSR.                    |
| D98H             | 3480 | MSR_C1_PMON_EVNT_SEL4    | Package | Uncore C-box 1 perfmon event select MSR.               |
| D99H             | 3481 | MSR_C1_PMON_CTR4         | Package | Uncore C-box 1 perfmon counter MSR.                    |
| D9AH             | 3482 | MSR_C1_PMON_EVNT_SEL5    | Package | Uncore C-box 1 perfmon event select MSR.               |
| D9BH             | 3483 | MSR_C1_PMON_CTR5         | Package | Uncore C-box 1 perfmon counter MSR.                    |

Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series (Contd.)

| Register Address |      | Register Name            | Scope   | Bit Description  |
|------------------|------|--------------------------|---------|--|
| Hex              | Dec  |                          |         |  |
| DA0H             | 3488 | MSR_C5_PMON_BOX_CTRL     | Package | Uncore C-box 5 perfmon local box control MSR.          |
| DA1H             | 3489 | MSR_C5_PMON_BOX_STATUS   | Package | Uncore C-box 5 perfmon local box status MSR.           |
| DA2H             | 3490 | MSR_C5_PMON_BOX_OVF_CTRL | Package | Uncore C-box 5 perfmon local box overflow control MSR. |
| DB0H             | 3504 | MSR_C5_PMON_EVNT_SEL0    | Package | Uncore C-box 5 perfmon event select MSR.               |
| DB1H             | 3505 | MSR_C5_PMON_CTR0         | Package | Uncore C-box 5 perfmon counter MSR.                    |
| DB2H             | 3506 | MSR_C5_PMON_EVNT_SEL1    | Package | Uncore C-box 5 perfmon event select MSR.               |
| DB3H             | 3507 | MSR_C5_PMON_CTR1         | Package | Uncore C-box 5 perfmon counter MSR.                    |
| DB4H             | 3508 | MSR_C5_PMON_EVNT_SEL2    | Package | Uncore C-box 5 perfmon event select MSR.               |
| DB5H             | 3509 | MSR_C5_PMON_CTR2         | Package | Uncore C-box 5 perfmon counter MSR.                    |
| DB6H             | 3510 | MSR_C5_PMON_EVNT_SEL3    | Package | Uncore C-box 5 perfmon event select MSR.               |
| DB7H             | 3511 | MSR_C5_PMON_CTR3         | Package | Uncore C-box 5 perfmon counter MSR.                    |
| DB8H             | 3512 | MSR_C5_PMON_EVNT_SEL4    | Package | Uncore C-box 5 perfmon event select MSR.               |
| DB9H             | 3513 | MSR_C5_PMON_CTR4         | Package | Uncore C-box 5 perfmon counter MSR.                    |
| DBAH             | 3514 | MSR_C5_PMON_EVNT_SEL5    | Package | Uncore C-box 5 perfmon event select MSR.               |
| DBBH             | 3515 | MSR_C5_PMON_CTR5         | Package | Uncore C-box 5 perfmon counter MSR.                    |
| DC0H             | 3520 | MSR_C3_PMON_BOX_CTRL     | Package | Uncore C-box 3 perfmon local box control MSR.          |
| DC1H             | 3521 | MSR_C3_PMON_BOX_STATUS   | Package | Uncore C-box 3 perfmon local box status MSR.           |
| DC2H             | 3522 | MSR_C3_PMON_BOX_OVF_CTRL | Package | Uncore C-box 3 perfmon local box overflow control MSR. |
| DD0H             | 3536 | MSR_C3_PMON_EVNT_SEL0    | Package | Uncore C-box 3 perfmon event select MSR.               |
| DD1H             | 3537 | MSR_C3_PMON_CTR0         | Package | Uncore C-box 3 perfmon counter MSR.                    |
| DD2H             | 3538 | MSR_C3_PMON_EVNT_SEL1    | Package | Uncore C-box 3 perfmon event select MSR.               |
| DD3H             | 3539 | MSR_C3_PMON_CTR1         | Package | Uncore C-box 3 perfmon counter MSR.                    |
| DD4H             | 3540 | MSR_C3_PMON_EVNT_SEL2    | Package | Uncore C-box 3 perfmon event select MSR.               |
| DD5H             | 3541 | MSR_C3_PMON_CTR2         | Package | Uncore C-box 3 perfmon counter MSR.                    |

Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series (Contd.)

| Register Address |      | Register Name            | Scope   | Bit Description  |
|------------------|------|--------------------------|---------|--|
| Hex              | Dec  |                          |         |  |
| DD6H             | 3542 | MSR_C3_PMON_EVNT_SEL3    | Package | Uncore C-box 3 perfmon event select MSR.               |
| DD7H             | 3543 | MSR_C3_PMON_CTR3         | Package | Uncore C-box 3 perfmon counter MSR.                    |
| DD8H             | 3544 | MSR_C3_PMON_EVNT_SEL4    | Package | Uncore C-box 3 perfmon event select MSR.               |
| DD9H             | 3545 | MSR_C3_PMON_CTR4         | Package | Uncore C-box 3 perfmon counter MSR.                    |
| DDAH             | 3546 | MSR_C3_PMON_EVNT_SEL5    | Package | Uncore C-box 3 perfmon event select MSR.               |
| DDBH             | 3547 | MSR_C3_PMON_CTR5         | Package | Uncore C-box 3 perfmon counter MSR.                    |
| DE0H             | 3552 | MSR_C7_PMON_BOX_CTRL     | Package | Uncore C-box 7 perfmon local box control MSR.          |
| DE1H             | 3553 | MSR_C7_PMON_BOX_STATUS   | Package | Uncore C-box 7 perfmon local box status MSR.           |
| DE2H             | 3554 | MSR_C7_PMON_BOX_OVF_CTRL | Package | Uncore C-box 7 perfmon local box overflow control MSR. |
| DF0H             | 3568 | MSR_C7_PMON_EVNT_SELO    | Package | Uncore C-box 7 perfmon event select MSR.               |
| DF1H             | 3569 | MSR_C7_PMON_CTR0         | Package | Uncore C-box 7 perfmon counter MSR.                    |
| DF2H             | 3570 | MSR_C7_PMON_EVNT_SEL1    | Package | Uncore C-box 7 perfmon event select MSR.               |
| DF3H             | 3571 | MSR_C7_PMON_CTR1         | Package | Uncore C-box 7 perfmon counter MSR.                    |
| DF4H             | 3572 | MSR_C7_PMON_EVNT_SEL2    | Package | Uncore C-box 7 perfmon event select MSR.               |
| DF5H             | 3573 | MSR_C7_PMON_CTR2         | Package | Uncore C-box 7 perfmon counter MSR.                    |
| DF6H             | 3574 | MSR_C7_PMON_EVNT_SEL3    | Package | Uncore C-box 7 perfmon event select MSR.               |
| DF7H             | 3575 | MSR_C7_PMON_CTR3         | Package | Uncore C-box 7 perfmon counter MSR.                    |
| DF8H             | 3576 | MSR_C7_PMON_EVNT_SEL4    | Package | Uncore C-box 7 perfmon event select MSR.               |
| DF9H             | 3577 | MSR_C7_PMON_CTR4         | Package | Uncore C-box 7 perfmon counter MSR.                    |
| DFAH             | 3578 | MSR_C7_PMON_EVNT_SEL5    | Package | Uncore C-box 7 perfmon event select MSR.               |
| DFBH             | 3579 | MSR_C7_PMON_CTR5         | Package | Uncore C-box 7 perfmon counter MSR.                    |
| E00H             | 3584 | MSR_R0_PMON_BOX_CTRL     | Package | Uncore R-box 0 perfmon local box control MSR.          |
| E01H             | 3585 | MSR_R0_PMON_BOX_STATUS   | Package | Uncore R-box 0 perfmon local box status MSR.           |
| E02H             | 3586 | MSR_R0_PMON_BOX_OVF_CTRL | Package | Uncore R-box 0 perfmon local box overflow control MSR. |
| E04H             | 3588 | MSR_R0_PMON_IPERFO_PO    | Package | Uncore R-box 0 perfmon IPERFO unit Port 0 select MSR.  |

Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series (Contd.)

| Register Address |      | Register Name          | Scope   | Bit Description                                       |
|------------------|------|------------------------|---------|---|
| Hex              | Dec  |                        |         |   |
| E05H             | 3589 | MSR_R0_PMON_IPERF0_P1  | Package | Uncore R-box 0 perfmon IPERF0 unit Port 1 select MSR. |
| E06H             | 3590 | MSR_R0_PMON_IPERF0_P2  | Package | Uncore R-box 0 perfmon IPERF0 unit Port 2 select MSR. |
| E07H             | 3591 | MSR_R0_PMON_IPERF0_P3  | Package | Uncore R-box 0 perfmon IPERF0 unit Port 3 select MSR. |
| E08H             | 3592 | MSR_R0_PMON_IPERF0_P4  | Package | Uncore R-box 0 perfmon IPERF0 unit Port 4 select MSR. |
| E09H             | 3593 | MSR_R0_PMON_IPERF0_P5  | Package | Uncore R-box 0 perfmon IPERF0 unit Port 5 select MSR. |
| E0AH             | 3594 | MSR_R0_PMON_IPERF0_P6  | Package | Uncore R-box 0 perfmon IPERF0 unit Port 6 select MSR. |
| E0BH             | 3595 | MSR_R0_PMON_IPERF0_P7  | Package | Uncore R-box 0 perfmon IPERF0 unit Port 7 select MSR. |
| E0CH             | 3596 | MSR_R0_PMON_QLX_P0     | Package | Uncore R-box 0 perfmon QLX unit Port 0 select MSR.    |
| E0DH             | 3597 | MSR_R0_PMON_QLX_P1     | Package | Uncore R-box 0 perfmon QLX unit Port 1 select MSR.    |
| E0EH             | 3598 | MSR_R0_PMON_QLX_P2     | Package | Uncore R-box 0 perfmon QLX unit Port 2 select MSR.    |
| E0FH             | 3599 | MSR_R0_PMON_QLX_P3     | Package | Uncore R-box 0 perfmon QLX unit Port 3 select MSR.    |
| E10H             | 3600 | MSR_R0_PMON_EVNT_SELO  | Package | Uncore R-box 0 perfmon event select MSR.              |
| E11H             | 3601 | MSR_R0_PMON_CTR0       | Package | Uncore R-box 0 perfmon counter MSR.                   |
| E12H             | 3602 | MSR_R0_PMON_EVNT_SEL1  | Package | Uncore R-box 0 perfmon event select MSR.              |
| E13H             | 3603 | MSR_R0_PMON_CTR1       | Package | Uncore R-box 0 perfmon counter MSR.                   |
| E14H             | 3604 | MSR_R0_PMON_EVNT_SEL2  | Package | Uncore R-box 0 perfmon event select MSR.              |
| E15H             | 3605 | MSR_R0_PMON_CTR2       | Package | Uncore R-box 0 perfmon counter MSR.                   |
| E16H             | 3606 | MSR_R0_PMON_EVNT_SEL3  | Package | Uncore R-box 0 perfmon event select MSR.              |
| E17H             | 3607 | MSR_R0_PMON_CTR3       | Package | Uncore R-box 0 perfmon counter MSR.                   |
| E18H             | 3608 | MSR_R0_PMON_EVNT_SEL4  | Package | Uncore R-box 0 perfmon event select MSR.              |
| E19H             | 3609 | MSR_R0_PMON_CTR4       | Package | Uncore R-box 0 perfmon counter MSR.                   |
| E1AH             | 3610 | MSR_R0_PMON_EVNT_SEL5  | Package | Uncore R-box 0 perfmon event select MSR.              |
| E1BH             | 3611 | MSR_R0_PMON_CTR5       | Package | Uncore R-box 0 perfmon counter MSR.                   |
| E1CH             | 3612 | MSR_R0_PMON_EVNT_SEL6  | Package | Uncore R-box 0 perfmon event select MSR.              |
| E1DH             | 3613 | MSR_R0_PMON_CTR6       | Package | Uncore R-box 0 perfmon counter MSR.                   |
| E1EH             | 3614 | MSR_R0_PMON_EVNT_SEL7  | Package | Uncore R-box 0 perfmon event select MSR.              |
| E1FH             | 3615 | MSR_R0_PMON_CTR7       | Package | Uncore R-box 0 perfmon counter MSR.                   |
| E20H             | 3616 | MSR_R1_PMON_BOX_CTRL   | Package | Uncore R-box 1 perfmon local box control MSR.         |
| E21H             | 3617 | MSR_R1_PMON_BOX_STATUS | Package | Uncore R-box 1 perfmon local box status MSR.          |

Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series (Contd.)

| Register Address |      | Register Name            | Scope   | Bit Description  |
|------------------|------|--------------------------|---------|--|
| Hex              | Dec  |                          |         |  |
| E22H             | 3618 | MSR_R1_PMON_BOX_OVF_CTRL | Package | Uncore R-box 1 perfmon local box overflow control MSR. |
| E24H             | 3620 | MSR_R1_PMON_IPERF1_P8    | Package | Uncore R-box 1 perfmon IPERF1 unit Port 8 select MSR.  |
| E25H             | 3621 | MSR_R1_PMON_IPERF1_P9    | Package | Uncore R-box 1 perfmon IPERF1 unit Port 9 select MSR.  |
| E26H             | 3622 | MSR_R1_PMON_IPERF1_P10   | Package | Uncore R-box 1 perfmon IPERF1 unit Port 10 select MSR. |
| E27H             | 3623 | MSR_R1_PMON_IPERF1_P11   | Package | Uncore R-box 1 perfmon IPERF1 unit Port 11 select MSR. |
| E28H             | 3624 | MSR_R1_PMON_IPERF1_P12   | Package | Uncore R-box 1 perfmon IPERF1 unit Port 12 select MSR. |
| E29H             | 3625 | MSR_R1_PMON_IPERF1_P13   | Package | Uncore R-box 1 perfmon IPERF1 unit Port 13 select MSR. |
| E2AH             | 3626 | MSR_R1_PMON_IPERF1_P14   | Package | Uncore R-box 1 perfmon IPERF1 unit Port 14 select MSR. |
| E2BH             | 3627 | MSR_R1_PMON_IPERF1_P15   | Package | Uncore R-box 1 perfmon IPERF1 unit Port 15 select MSR. |
| E2CH             | 3628 | MSR_R1_PMON_QLX_P4       | Package | Uncore R-box 1 perfmon QLX unit Port 4 select MSR.     |
| E2DH             | 3629 | MSR_R1_PMON_QLX_P5       | Package | Uncore R-box 1 perfmon QLX unit Port 5 select MSR.     |
| E2EH             | 3630 | MSR_R1_PMON_QLX_P6       | Package | Uncore R-box 1 perfmon QLX unit Port 6 select MSR.     |
| E2FH             | 3631 | MSR_R1_PMON_QLX_P7       | Package | Uncore R-box 1 perfmon QLX unit Port 7 select MSR.     |
| E30H             | 3632 | MSR_R1_PMON_EVNT_SEL8    | Package | Uncore R-box 1 perfmon event select MSR.               |
| E31H             | 3633 | MSR_R1_PMON_CTR8         | Package | Uncore R-box 1 perfmon counter MSR.                    |
| E32H             | 3634 | MSR_R1_PMON_EVNT_SEL9    | Package | Uncore R-box 1 perfmon event select MSR.               |
| E33H             | 3635 | MSR_R1_PMON_CTR9         | Package | Uncore R-box 1 perfmon counter MSR.                    |
| E34H             | 3636 | MSR_R1_PMON_EVNT_SEL10   | Package | Uncore R-box 1 perfmon event select MSR.               |
| E35H             | 3637 | MSR_R1_PMON_CTR10        | Package | Uncore R-box 1 perfmon counter MSR.                    |
| E36H             | 3638 | MSR_R1_PMON_EVNT_SEL11   | Package | Uncore R-box 1 perfmon event select MSR.               |
| E37H             | 3639 | MSR_R1_PMON_CTR11        | Package | Uncore R-box 1 perfmon counter MSR.                    |
| E38H             | 3640 | MSR_R1_PMON_EVNT_SEL12   | Package | Uncore R-box 1 perfmon event select MSR.               |
| E39H             | 3641 | MSR_R1_PMON_CTR12        | Package | Uncore R-box 1 perfmon counter MSR.                    |
| E3AH             | 3642 | MSR_R1_PMON_EVNT_SEL13   | Package | Uncore R-box 1 perfmon event select MSR.               |
| E3BH             | 3643 | MSR_R1_PMON_CTR13        | Package | Uncore R-box 1 perfmon counter MSR.                    |
| E3CH             | 3644 | MSR_R1_PMON_EVNT_SEL14   | Package | Uncore R-box 1 perfmon event select MSR.               |

**Table 2-16. Additional MSRs in Intel® Xeon® Processor 7500 Series (Contd.)**

| Register Address |      | Register Name          | Scope   | Bit Description  |
|------------------|------|------------------------|---------|--|
| Hex              | Dec  |                        |         |  |
| E3DH             | 3645 | MSR_R1_PMON_CTR14      | Package | Uncore R-box 1 perfmon counter MSR.  |
| E3EH             | 3646 | MSR_R1_PMON_EVNT_SEL15 | Package | Uncore R-box 1 perfmon event select MSR.                                   |
| E3FH             | 3647 | MSR_R1_PMON_CTR15      | Package | Uncore R-box 1 perfmon counter MSR.  |
| E45H             | 3653 | MSR_B0_PMON_MATCH      | Package | Uncore B-box 0 perfmon local box match MSR.                                |
| E46H             | 3654 | MSR_B0_PMON_MASK       | Package | Uncore B-box 0 perfmon local box mask MSR.                                 |
| E49H             | 3657 | MSR_S0_PMON_MATCH      | Package | Uncore S-box 0 perfmon local box match MSR.                                |
| E4AH             | 3658 | MSR_S0_PMON_MASK       | Package | Uncore S-box 0 perfmon local box mask MSR.                                 |
| E4DH             | 3661 | MSR_B1_PMON_MATCH      | Package | Uncore B-box 1 perfmon local box match MSR.                                |
| E4EH             | 3662 | MSR_B1_PMON_MASK       | Package | Uncore B-box 1 perfmon local box mask MSR.                                 |
| E54H             | 3668 | MSR_M0_PMON_MM_CONFIG  | Package | Uncore M-box 0 perfmon local box address match/mask config MSR.            |
| E55H             | 3669 | MSR_M0_PMON_ADDR_MATCH | Package | Uncore M-box 0 perfmon local box address match MSR.                        |
| E56H             | 3670 | MSR_M0_PMON_ADDR_MASK  | Package | Uncore M-box 0 perfmon local box address mask MSR.                         |
| E59H             | 3673 | MSR_S1_PMON_MATCH      | Package | Uncore S-box 1 perfmon local box match MSR.                                |
| E5AH             | 3674 | MSR_S1_PMON_MASK       | Package | Uncore S-box 1 perfmon local box mask MSR.                                 |
| E5CH             | 3676 | MSR_M1_PMON_MM_CONFIG  | Package | Uncore M-box 1 perfmon local box address match/mask config MSR.            |
| E5DH             | 3677 | MSR_M1_PMON_ADDR_MATCH | Package | Uncore M-box 1 perfmon local box address match MSR.                        |
| E5EH             | 3678 | MSR_M1_PMON_ADDR_MASK  | Package | Uncore M-box 1 perfmon local box address mask MSR.                         |
| 3B5H             | 965  | MSR_UNCORE_PMC5        | Package | See Section 18.3.1.2.2, "Uncore Performance Event Configuration Facility." |

## 2.8 MSRS IN THE INTEL® XEON® PROCESSOR 5600 SERIES (BASED ON INTEL® MICROARCHITECTURE CODE NAME WESTMERE)

Intel® Xeon® Processor 5600 Series (based on Intel® microarchitecture code name Westmere) supports the MSR interfaces listed in Table 2-14, Table 2-15, plus additional MSR listed in Table 2-17. These MSRs apply to Intel Core i7, i5 and i3 processor family with CPUID signature DisplayFamily\_DisplayModel of 06\_25H and 06\_2CH, see Table 2-1.

**Table 2-17. Additional MSRs Supported by Intel Processors  
(Based on Intel® Microarchitecture Code Name Westmere)**

| Register Address |     | Register Name         | Scope   | Bit Description  |
|------------------|-----|-----------------------|---------|--|
| Hex              | Dec |                       |         |  |
| 13CH             | 52  | MSR_FEATURE_CONFIG    | Core    | <b>AES Configuration (RW-L)</b><br>Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.  |
|                  |     | 1:0                   |         | <b>AES Configuration (RW-L)</b><br>Upon a successful read of this MSR, the configuration of AES instruction set availability is as follows:<br>11b: AES instructions are not available until next RESET.<br>otherwise, AES instructions are available.<br>Note, AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instruction can be mis-configured if a privileged agent unintentionally writes 11b. |
|                  |     | 63:2                  |         | Reserved.  |
| 1A7H             | 423 | MSR_OFFCORE_RSP_1     | Thread  | <b>Offcore Response Event Select Register (R/W)</b>  |
| 1ADH             | 429 | MSR_TURBO_RATIO_LIMIT | Package | <b>Maximum Ratio Limit of Turbo Mode</b><br>RO if MSR_PLATFORM_INFO.[28] = 0,<br>RW if MSR_PLATFORM_INFO.[28] = 1  |
|                  |     | 7:0                   | Package | <b>Maximum Ratio Limit for 1C</b><br>Maximum turbo ratio limit of 1 core active.   |
|                  |     | 15:8                  | Package | <b>Maximum Ratio Limit for 2C</b><br>Maximum turbo ratio limit of 2 core active.   |
|                  |     | 23:16                 | Package | <b>Maximum Ratio Limit for 3C</b><br>Maximum turbo ratio limit of 3 core active.   |
|                  |     | 31:24                 | Package | <b>Maximum Ratio Limit for 4C</b><br>Maximum turbo ratio limit of 4 core active.   |
|                  |     | 39:32                 | Package | <b>Maximum Ratio Limit for 5C</b><br>Maximum turbo ratio limit of 5 core active.   |
|                  |     | 47:40                 | Package | <b>Maximum Ratio Limit for 6C</b><br>Maximum turbo ratio limit of 6 core active.   |
|                  |     | 63:48                 |         | Reserved.  |
| 1B0H             | 432 | IA32_ENERGY_PERF_BIAS | Package | See Table 2-2.   |

## 2.9 MSRS IN THE INTEL® XEON® PROCESSOR E7 FAMILY (BASED ON INTEL® MICROARCHITECTURE CODE NAME WESTMERE)

Intel® Xeon® Processor E7 Family (based on Intel® microarchitecture code name Westmere) supports the MSR interfaces listed in Table 2-14 (except MSR address 1ADH), Table 2-15, plus additional MSR listed in Table 2-18. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_2FH.

Table 2-18. Additional MSRs Supported by Intel® Xeon® Processor E7 Family

| Register Address |      | Register Name            | Scope   | Bit Description  |
|------------------|------|--------------------------|---------|--|
| Hex              | Dec  |                          |         |  |
| 13CH             | 52   | MSR_FEATURE_CONFIG       | Core    | <b>AES Configuration (RW-L)</b><br>Privileged post-BIOS agent must provide a #GP handler to handle unsuccessful read of this MSR.  |
|                  |      | 1:0                      |         | <b>AES Configuration (RW-L)</b><br>Upon a successful read of this MSR, the configuration of AES instruction set availability is as follows:<br>11b: AES instructions are not available until next RESET.<br>otherwise, AES instructions are available.<br>Note, AES instruction set is not available if read is unsuccessful. If the configuration is not 01b, AES instruction can be mis-configured if a privileged agent unintentionally writes 11b. |
|                  |      | 63:2                     |         | Reserved.  |
| 1A7H             | 423  | MSR_OFFCORE_RSP_1        | Thread  | <b>Offcore Response Event Select Register (R/W)</b>  |
| 1ADH             | 429  | MSR_TURBO_RATIO_LIMIT    | Package | <b>Reserved</b><br>Attempt to read/write will cause #UD.   |
| 1B0H             | 432  | IA32_ENERGY_PERF_BIAS    | Package | See Table 2-2.   |
| F40H             | 3904 | MSR_C8_PMON_BOX_CTRL     | Package | Uncore C-box 8 perfmon local box control MSR.  |
| F41H             | 3905 | MSR_C8_PMON_BOX_STATUS   | Package | Uncore C-box 8 perfmon local box status MSR.   |
| F42H             | 3906 | MSR_C8_PMON_BOX_OVF_CTRL | Package | Uncore C-box 8 perfmon local box overflow control MSR.   |
| F50H             | 3920 | MSR_C8_PMON_EVNT_SELO    | Package | Uncore C-box 8 perfmon event select MSR.   |
| F51H             | 3921 | MSR_C8_PMON_CTR0         | Package | Uncore C-box 8 perfmon counter MSR.  |
| F52H             | 3922 | MSR_C8_PMON_EVNT_SEL1    | Package | Uncore C-box 8 perfmon event select MSR.   |
| F53H             | 3923 | MSR_C8_PMON_CTR1         | Package | Uncore C-box 8 perfmon counter MSR.  |
| F54H             | 3924 | MSR_C8_PMON_EVNT_SEL2    | Package | Uncore C-box 8 perfmon event select MSR.   |
| F55H             | 3925 | MSR_C8_PMON_CTR2         | Package | Uncore C-box 8 perfmon counter MSR.  |
| F56H             | 3926 | MSR_C8_PMON_EVNT_SEL3    | Package | Uncore C-box 8 perfmon event select MSR.   |
| F57H             | 3927 | MSR_C8_PMON_CTR3         | Package | Uncore C-box 8 perfmon counter MSR.  |
| F58H             | 3928 | MSR_C8_PMON_EVNT_SEL4    | Package | Uncore C-box 8 perfmon event select MSR.   |
| F59H             | 3929 | MSR_C8_PMON_CTR4         | Package | Uncore C-box 8 perfmon counter MSR.  |
| F5AH             | 3930 | MSR_C8_PMON_EVNT_SEL5    | Package | Uncore C-box 8 perfmon event select MSR.   |
| F5BH             | 3931 | MSR_C8_PMON_CTR5         | Package | Uncore C-box 8 perfmon counter MSR.  |

**Table 2-18. Additional MSRs Supported by Intel® Xeon® Processor E7 Family (Contd.)**

| Register Address |      | Register Name            | Scope   | Bit Description  |
|------------------|------|--------------------------|---------|--|

## 2.10 MSRS IN INTEL® PROCESSOR FAMILY BASED ON INTEL® MICROARCHITECTURE CODE NAME SANDY BRIDGE

Table 2-19 lists model-specific registers (MSRs) that are common to Intel® processor family based on Intel microarchitecture code name Sandy Bridge. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_2AH, 06\_2DH, see Table 2-1. Additional MSRs specific to 06\_2AH are listed in Table 2-20.

**Table 2-19. MSRs Supported by Intel® Processors  
based on Intel® microarchitecture code name Sandy Bridge**

| Register Address |     | Register Name   | Scope  | Bit Description                                 |
|------------------|-----|-----------------|--------|---|
| Hex              | Dec |                 |        |   |
| 0H               | 0   | IA32_P5_MC_ADDR | Thread | See Section 2.22, “MSRs in Pentium Processors.” |
| 1H               | 1   | IA32_P5_MC_TYPE | Thread | See Section 2.22, “MSRs in Pentium Processors.” |

**Table 2-19. MSRs Supported by Intel® Processors  
based on Intel® microarchitecture code name Sandy Bridge (Contd.)**

| Register Address |     | Register Name            | Scope   | Bit Description  |
|------------------|-----|--------------------------|---------|--|
| Hex              | Dec |                          |         |  |
| 6H               | 6   | IA32_MONITOR_FILTER_SIZE | Thread  | See Section 8.10.5, "Monitor/Mwait Address Range Determination," and Table 2-2.  |
| 10H              | 16  | IA32_TIME_STAMP_COUNTER  | Thread  | See Section 17.17, "Time-Stamp Counter," and see Table 2-2.  |
| 17H              | 23  | IA32_PLATFORM_ID         | Package | <b>Platform ID (R)</b><br>See Table 2-2.   |
| 1BH              | 27  | IA32_APIC_BASE           | Thread  | See Section 10.4.4, "Local APIC Status and Location," and Table 2-2.   |
| 34H              | 52  | MSR_SMI_COUNT            | Thread  | <b>SMI Counter (R/O)</b>   |
|                  |     | 31:0                     |         | <b>SMI Count (R/O)</b><br>Count SMIs.  |
|                  |     | 63:32                    |         | Reserved.  |
| 3AH              | 58  | IA32_FEATURE_CONTROL     | Thread  | <b>Control Features in Intel 64 Processor (R/W)</b><br>See Table 2-2.  |
|                  |     | 0                        |         | <b>Lock (R/WL)</b>   |
|                  |     | 1                        |         | <b>Enable VMX inside SMX operation (R/WL)</b>  |
|                  |     | 2                        |         | <b>Enable VMX outside SMX operation (R/WL)</b>   |
|                  |     | 14:8                     |         | <b>SENTER local functions enables (R/WL)</b>   |
|                  |     | 15                       |         | <b>SENTER global functions enable (R/WL)</b>   |
| 79H              | 121 | IA32_BIOS_UPDT_TRIG      | Core    | <b>BIOS Update Trigger Register (W)</b><br>See Table 2-2.  |
| 8BH              | 139 | IA32_BIOS_SIGN_ID        | Thread  | <b>BIOS Update Signature ID (RO)</b><br>See Table 2-2.   |
| C1H              | 193 | IA32_PMC0                | Thread  | <b>Performance Counter Register</b><br>See Table 2-2.  |
| C2H              | 194 | IA32_PMC1                | Thread  | <b>Performance Counter Register</b><br>See Table 2-2.  |
| C3H              | 195 | IA32_PMC2                | Thread  | <b>Performance Counter Register</b><br>See Table 2-2.  |
| C4H              | 196 | IA32_PMC3                | Thread  | <b>Performance Counter Register</b><br>See Table 2-2.  |
| C5H              | 197 | IA32_PMC4                | Core    | <b>Performance Counter Register (if core not shared by threads)</b>  |
| C6H              | 198 | IA32_PMC5                | Core    | <b>Performance Counter Register (if core not shared by threads)</b>  |
| C7H              | 199 | IA32_PMC6                | Core    | <b>Performance Counter Register (if core not shared by threads)</b>  |
| C8H              | 200 | IA32_PMC7                | Core    | <b>Performance Counter Register (if core not shared by threads)</b>  |
| CEH              | 206 | MSR_PLATFORM_INFO        | Package | Platform Information; contains power management and other model specific features enumeration. See <a href="http://biosbits.org">http://biosbits.org</a> . |
|                  |     | 7:0                      |         | Reserved.  |

based on Intel® microarchitecture code name Sandy Bridge (Contd.)**

| Register Address |      | Register Name                       | Scope   | Bit Description   |
|------------------|------|-------------------------------------|---------|---|
| Hex              | Dec  |                                     |         |   |
| 489H             | 1161 | IA32_VMX_CR4_FIXED1                 | Thread  | <b>Capability Reporting Register of CR4 Bits Fixed to 1 (R/O)</b><br>See Table 2-2.<br>See Appendix A.8, “VMX-Fixed Bits in CR4.”   |
| 48AH             | 1162 | IA32_VMX_VMCS_ENUM                  | Thread  | <b>Capability Reporting Register of VMCS Field Enumeration (R/O)</b><br>See Table 2-2.<br>See Appendix A.9, “VMCS Enumeration.”   |
| 48BH             | 1163 | IA32_VMX_PROCBASED_CTLD2            | Thread  | <b>Capability Reporting Register of Secondary Processor-based VM-execution Controls (R/O)</b><br>See Appendix A.3, “VM-Execution Controls.”   |
| 48CH             | 1164 | IA32_VMX_EPT_VPID_ENUM              | Thread  | <b>Capability Reporting Register of EPT and VPID (R/O)</b><br>See Table 2-2   |
| 48DH             | 1165 | IA32_VMX_TRUE_PINBASED_CTLD         | Thread  | <b>Capability Reporting Register of Pin-based VM-execution Flex Controls (R/O)</b><br>See Table 2-2   |
| 48EH             | 1166 | IA32_VMX_TRUE_PROCBASED_CTLD        | Thread  | <b>Capability Reporting Register of Primary Processor-based VM-execution Flex Controls (R/O)</b><br>See Table 2-2   |
| 48FH             | 1167 | IA32_VMX_TRUE_EXIT_CTLD             | Thread  | <b>Capability Reporting Register of VM-exit Flex Controls (R/O)</b><br>See Table 2-2  |
| 490H             | 1168 | IA32_VMX_TRUE_ENTRY_CTLD            | Thread  | <b>Capability Reporting Register of VM-entry Flex Controls (R/O)</b><br>See Table 2-2   |
| 4C1H             | 1217 | IA32_A_PMC0                         | Thread  | See Table 2-2.  |
| 4C2H             | 1218 | IA32_A_PMC1                         | Thread  | See Table 2-2.  |
| 4C3H             | 1219 | IA32_A_PMC2                         | Thread  | See Table 2-2.  |
| 4C4H             | 1220 | IA32_A_PMC3                         | Thread  | See Table 2-2.  |
| 4C5H             | 1221 | IA32_A_PMC4                         | Core    | See Table 2-2.  |
| 4C6H             | 1222 | IA32_A_PMC5                         | Core    | See Table 2-2.  |
| 4C7H             | 1223 | IA32_A_PMC6                         | Core    | See Table 2-2.  |
| 4C8H             | 1224 | IA32_A_PMC7                         | Core    | See Table 2-2.  |
| 600H             | 1536 | IA32_DS_AREA                        | Thread  | <b>DS Save Area (R/W)</b><br>See Table 2-2.<br>See Section 18.6.3.4, “Debug Store (DS) Mechanism.”  |
| 606H             | 1542 | MSR_RAPL_POWER_UNIT                 | Package | <b>Unit Multipliers used in RAPL Interfaces (R/O)</b><br>See Section 14.9.1, “RAPL Interfaces.”   |
| 60AH             | 1546 | MSR_PKG_C3_INTERRUPT_RESPONSE_LIMIT | Package | <b>Package C3 Interrupt Response Limit (R/W)</b><br>Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. |

**Table 2-19. MSRs Supported by Intel® Processors  
based on Intel® microarchitecture code name Sandy Bridge (Contd.)**

| Register Address |      | Register Name  | Scope   | Bit Description   |
|------------------|------|----------------|---------|---|
| Hex              | Dec  |                |         |   |
|                  |      | 9:0            |         | <b>Interrupt response time limit (R/W)</b><br>Specifies the limit that should be used to decide if the package should be put into a package C3 state.   |
|                  |      | 12:10          |         | <b>Time Unit (R/W)</b><br>Specifies the encoding value of time unit of the interrupt response time limit. The following time unit encodings are supported:<br>000b: 1 ns<br>001b: 32 ns<br>010b: 1024 ns<br>011b: 32768 ns<br>100b: 1048576 ns<br>101b: 33554432 ns   |
|                  |      | 14:13          |         | Reserved.   |
|                  |      | 15             |         | <b>Valid (R/W)</b><br>Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-state management.  |
|                  |      | 63:16          |         | Reserved.   |
| 60BH             | 1547 | MSR_PKGC6_IRTL | Package | <b>Package C6 Interrupt Response Limit (R/W)</b><br>This MSR defines the budget allocated for the package to exit from C6 to a C0 state, where interrupt request can be delivered to the core and serviced. Additional core-exit latency may be applicable depending on the actual C-state the core is in.<br>Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. |
|                  |      | 9:0            |         | <b>Interrupt response time limit (R/W)</b><br>Specifies the limit that should be used to decide if the package should be put into a package C6 state.   |
|                  |      | 12:10          |         | <b>Time Unit (R/W)</b><br>Specifies the encoding value of time unit of the interrupt response time limit. The following time unit encodings are supported:<br>000b: 1 ns<br>001b: 32 ns<br>010b: 1024 ns<br>011b: 32768 ns<br>100b: 1048576 ns<br>101b: 33554432 ns   |
|                  |      | 14:13          |         | Reserved.   |
|                  |      | 15             |         | <b>Valid (R/W)</b><br>Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-state management.  |
|                  |      | 63:16          |         | Reserved.   |

**Table 2-19. MSRs Supported by Intel® Processors  
based on Intel® microarchitecture code name Sandy Bridge (Contd.)**

| Register Address |      | Register Name             | Scope   | Bit Description  |
|------------------|------|---------------------------|---------|--|

| C000_0103H       |      | IA32_TSC_AUX             | Thread | <b>AUXILIARY TSC Signature (R/W)</b><br>See Table 2-2 and Section 17.17.2, "IA32_TSC_AUX Register and RDTSCP Support." |

### 2.10.1 MSRs In 2nd Generation Intel® Core™ Processor Family (Based on Intel® Microarchitecture Code Name Sandy Bridge)

Table 2-20 and Table 2-21 list model-specific registers (MSRs) that are specific to the 2nd generation Intel® Core™ processor family (based on Intel microarchitecture code name Sandy Bridge). These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_2AH; see Table 2-1.

**Table 2-20. MSRs Supported by 2nd Generation Intel® Core™ Processors (Intel® microarchitecture code name Sandy Bridge)**

| Register Address |      | Register Name         | Scope   | Bit Description   |
|------------------|------|-----------------------|---------|---|
| Hex              | Dec  |                       |         |   |
| 1ADH             | 429  | MSR_TURBO_RATIO_LIMIT | Package | <b>Maximum Ratio Limit of Turbo Mode</b><br>RO if MSR_PLATFORM_INFO.[28] = 0,<br>RW if MSR_PLATFORM_INFO.[28] = 1   |
|                  |      | 7:0                   | Package | <b>Maximum Ratio Limit for 1C</b><br>Maximum turbo ratio limit of 1 core active.  |
|                  |      | 15:8                  | Package | <b>Maximum Ratio Limit for 2C</b><br>Maximum turbo ratio limit of 2 core active.  |
|                  |      | 23:16                 | Package | <b>Maximum Ratio Limit for 3C</b><br>Maximum turbo ratio limit of 3 core active.  |
|                  |      | 31:24                 | Package | <b>Maximum Ratio Limit for 4C</b><br>Maximum turbo ratio limit of 4 core active.  |
|                  |      | 63:32                 |         | Reserved.   |
| 60CH             | 1548 | MSR_PKGC7_IRTL        | Package | <b>Package C7 Interrupt Response Limit (R/W)</b><br>This MSR defines the budget allocated for the package to exit from C7 to a C0 state, where interrupt request can be delivered to the core and serviced. Additional core-exit latency may be applicable depending on the actual C-state the core is in.<br>Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States. |
|                  |      | 9:0                   |         | <b>Interrupt response time limit (R/W)</b><br>Specifies the limit that should be used to decide if the package should be put into a package C7 state.   |
|                  |      | 12:10                 |         | <b>Time Unit (R/W)</b><br>Specifies the encoding value of time unit of the interrupt response time limit. The following time unit encodings are supported:<br>000b: 1 ns<br>001b: 32 ns<br>010b: 1024 ns<br>011b: 32768 ns<br>100b: 1048576 ns<br>101b: 33554432 ns   |
|                  |      | 14:13                 |         | Reserved.   |
|                  |      | 15                    |         | <b>Valid (R/W)</b><br>Indicates whether the values in bits 12:0 are valid and can be used by the processor for package C-state management.  |
|                  |      | 63:16                 |         | Reserved.   |
| 639H             | 1593 | MSR_PP0_ENERGY_STATUS | Package | <b>PP0 Energy Status (R/O)</b><br>See Section 14.9.4, "PP0/PP1 RAPL Domains."   |

**Table 2-20. MSRs Supported by 2nd Generation Intel® Core™ Processors (Intel® microarchitecture code name Sandy Bridge) (Contd.)**

| Register Address |      | Register Name         | Scope   | Bit Description  |
|------------------|------|-----------------------|---------|--|
| Hex              | Dec  |                       |         |  |
| 63AH             | 1594 | MSR_PP0_POLICY        | Package | <b>PP0 Balance Policy (R/W)</b><br>See Section 14.9.4, “PP0/PP1 RAPL Domains.”           |
| 640H             | 1600 | MSR_PP1_POWER_LIMIT   | Package | <b>PP1 RAPL Power Limit Control (R/W)</b><br>See Section 14.9.4, “PP0/PP1 RAPL Domains.” |
| 641H             | 1601 | MSR_PP1_ENERGY_STATUS | Package | <b>PP1 Energy Status (R/O)</b><br>See Section 14.9.4, “PP0/PP1 RAPL Domains.”            |
| 642H             | 1602 | MSR_PP1_POLICY        | Package | <b>PP1 Balance Policy (R/W)</b><br>See Section 14.9.4, “PP0/PP1 RAPL Domains.”           |

See Table 2-19, Table 2-20, and Table 2-21 for MSR definitions applicable to processors with CPUID signature 06\_2AH.

Table 2-21 lists the MSRs of uncore PMU for Intel processors with CPUID signature 06\_2AH.

**Table 2-21. Uncore PMU MSRs Supported by 2nd Generation Intel® Core™ Processors**

| Register Address |     | Register Name              | Scope   | Bit Description                          |
|------------------|-----|----------------------------|---------|--|
| Hex              | Dec |                            |         |  |
| 391H             | 913 | MSR_UNC_PERF_GLOBAL_CTRL   | Package | Uncore PMU global control                |
|                  |     | 0                          |         | Slice 0 select                           |
|                  |     | 1                          |         | Slice 1 select                           |
|                  |     | 2                          |         | Slice 2 select                           |
|                  |     | 3                          |         | Slice 3 select                           |
|                  |     | 4                          |         | Slice 4 select                           |
|                  |     | 18:5                       |         | Reserved.                                |
|                  |     | 29                         |         | Enable all uncore counters               |
|                  |     | 30                         |         | Enable wake on PMI                       |
|                  |     | 31                         |         | Enable Freezing counter when overflow    |
|                  |     | 63:32                      |         | Reserved.                                |
| 392H             | 914 | MSR_UNC_PERF_GLOBAL_STATUS | Package | Uncore PMU main status                   |
|                  |     | 0                          |         | Fixed counter overflowed                 |
|                  |     | 1                          |         | An ARB counter overflowed                |
|                  |     | 2                          |         | Reserved                                 |
|                  |     | 3                          |         | A CBox counter overflowed (on any slice) |
|                  |     | 63:4                       |         | Reserved.                                |
| 394H             | 916 | MSR_UNC_PERF_FIXED_CTRL    | Package | Uncore fixed counter control (R/W)       |
|                  |     | 19:0                       |         | Reserved                                 |
|                  |     | 20                         |         | Enable overflow propagation              |

Table 2-21. Uncore PMU MSRs Supported by 2nd Generation Intel® Core™ Processors

| Register Address |      | Register Name             | Scope   | Bit Description   |
|------------------|------|---------------------------|---------|---|
| Hex              | Dec  |                           |         |   |
|                  |      | 21                        |         | Reserved  |
|                  |      | 22                        |         | Enable counting   |
|                  |      | 63:23                     |         | Reserved.   |
| 395H             | 917  | MSR_UNC_PERF_FIXED_CTR    | Package | Uncore fixed counter  |
|                  |      | 47:0                      |         | Current count   |
|                  |      | 63:48                     |         | Reserved.   |
| 396H             | 918  | MSR_UNC_CBO_CONFIG        | Package | Uncore C-Box configuration information (R/O)  |
|                  |      | 3:0                       |         | Report the number of C-Box units with performance counters, including processor cores and processor graphics" |
|                  |      | 63:4                      |         | Reserved.   |
| 3B0H             | 946  | MSR_UNC_ARB_PERFCTR0      | Package | Uncore Arb unit, performance counter 0  |
| 3B1H             | 947  | MSR_UNC_ARB_PERFCTR1      | Package | Uncore Arb unit, performance counter 1  |
| 3B2H             | 944  | MSR_UNC_ARB_PERFEVTSEL0   | Package | Uncore Arb unit, counter 0 event select MSR   |
| 3B3H             | 945  | MSR_UNC_ARB_PERFEVTSEL1   | Package | Uncore Arb unit, counter 1 event select MSR   |
| 700H             | 1792 | MSR_UNC_CBO_0_PERFEVTSEL0 | Package | Uncore C-Box 0, counter 0 event select MSR  |
| 701H             | 1793 | MSR_UNC_CBO_0_PERFEVTSEL1 | Package | Uncore C-Box 0, counter 1 event select MSR  |
| 702H             | 1794 | MSR_UNC_CBO_0_PERFEVTSEL2 | Package | Uncore C-Box 0, counter 2 event select MSR.   |
| 703H             | 1795 | MSR_UNC_CBO_0_PERFEVTSEL3 | Package | Uncore C-Box 0, counter 3 event select MSR.   |
| 705H             | 1797 | MSR_UNC_CBO_0_UNIT_STATUS | Package | Uncore C-Box 0, unit status for counter 0-3   |
| 706H             | 1798 | MSR_UNC_CBO_0_PERFCTR0    | Package | Uncore C-Box 0, performance counter 0   |
| 707H             | 1799 | MSR_UNC_CBO_0_PERFCTR1    | Package | Uncore C-Box 0, performance counter 1   |
| 708H             | 1800 | MSR_UNC_CBO_0_PERFCTR2    | Package | Uncore C-Box 0, performance counter 2.  |
| 709H             | 1801 | MSR_UNC_CBO_0_PERFCTR3    | Package | Uncore C-Box 0, performance counter 3.  |
| 710H             | 1808 | MSR_UNC_CBO_1_PERFEVTSEL0 | Package | Uncore C-Box 1, counter 0 event select MSR  |
| 711H             | 1809 | MSR_UNC_CBO_1_PERFEVTSEL1 | Package | Uncore C-Box 1, counter 1 event select MSR  |
| 712H             | 1810 | MSR_UNC_CBO_1_PERFEVTSEL2 | Package | Uncore C-Box 1, counter 2 event select MSR.   |
| 713H             | 1811 | MSR_UNC_CBO_1_PERFEVTSEL3 | Package | Uncore C-Box 1, counter 3 event select MSR.   |

Table 2-21. Uncore PMU MSRs Supported by 2nd Generation Intel® Core™ Processors

| Register Address |      | Register Name             | Scope   | Bit Description                             |
|------------------|------|---------------------------|---------|---|
| Hex              | Dec  |                           |         |   |
| 715H             | 1813 | MSR_UNC_CBO_1_UNIT_STATUS | Package | Uncore C-Box 1, unit status for counter 0-3 |
| 716H             | 1814 | MSR_UNC_CBO_1_PERFCTR0    | Package | Uncore C-Box 1, performance counter 0       |
| 717H             | 1815 | MSR_UNC_CBO_1_PERFCTR1    | Package | Uncore C-Box 1, performance counter 1       |
| 718H             | 1816 | MSR_UNC_CBO_1_PERFCTR2    | Package | Uncore C-Box 1, performance counter 2.      |
| 719H             | 1817 | MSR_UNC_CBO_1_PERFCTR3    | Package | Uncore C-Box 1, performance counter 3.      |
| 720H             | 1824 | MSR_UNC_CBO_2_PERFEVTSEL0 | Package | Uncore C-Box 2, counter 0 event select MSR  |
| 721H             | 1825 | MSR_UNC_CBO_2_PERFEVTSEL1 | Package | Uncore C-Box 2, counter 1 event select MSR  |
| 722H             | 1826 | MSR_UNC_CBO_2_PERFEVTSEL2 | Package | Uncore C-Box 2, counter 2 event select MSR. |
| 723H             | 1827 | MSR_UNC_CBO_2_PERFEVTSEL3 | Package | Uncore C-Box 2, counter 3 event select MSR. |
| 725H             | 1829 | MSR_UNC_CBO_2_UNIT_STATUS | Package | Uncore C-Box 2, unit status for counter 0-3 |
| 726H             | 1830 | MSR_UNC_CBO_2_PERFCTR0    | Package | Uncore C-Box 2, performance counter 0       |
| 727H             | 1831 | MSR_UNC_CBO_2_PERFCTR1    | Package | Uncore C-Box 2, performance counter 1       |
| 728H             | 1832 | MSR_UNC_CBO_3_PERFCTR2    | Package | Uncore C-Box 3, performance counter 2.      |
| 729H             | 1833 | MSR_UNC_CBO_3_PERFCTR3    | Package | Uncore C-Box 3, performance counter 3.      |
| 730H             | 1840 | MSR_UNC_CBO_3_PERFEVTSEL0 | Package | Uncore C-Box 3, counter 0 event select MSR  |
| 731H             | 1841 | MSR_UNC_CBO_3_PERFEVTSEL1 | Package | Uncore C-Box 3, counter 1 event select MSR. |
| 732H             | 1842 | MSR_UNC_CBO_3_PERFEVTSEL2 | Package | Uncore C-Box 3, counter 2 event select MSR. |
| 733H             | 1843 | MSR_UNC_CBO_3_PERFEVTSEL3 | Package | Uncore C-Box 3, counter 3 event select MSR. |
| 735H             | 1845 | MSR_UNC_CBO_3_UNIT_STATUS | Package | Uncore C-Box 3, unit status for counter 0-3 |
| 736H             | 1846 | MSR_UNC_CBO_3_PERFCTR0    | Package | Uncore C-Box 3, performance counter 0.      |
| 737H             | 1847 | MSR_UNC_CBO_3_PERFCTR1    | Package | Uncore C-Box 3, performance counter 1.      |
| 738H             | 1848 | MSR_UNC_CBO_3_PERFCTR2    | Package | Uncore C-Box 3, performance counter 2.      |
| 739H             | 1849 | MSR_UNC_CBO_3_PERFCTR3    | Package | Uncore C-Box 3, performance counter 3.      |
| 740H             | 1856 | MSR_UNC_CBO_4_PERFEVTSEL0 | Package | Uncore C-Box 4, counter 0 event select MSR  |
| 741H             | 1857 | MSR_UNC_CBO_4_PERFEVTSEL1 | Package | Uncore C-Box 4, counter 1 event select MSR. |
| 742H             | 1858 | MSR_UNC_CBO_4_PERFEVTSEL2 | Package | Uncore C-Box 4, counter 2 event select MSR. |

| 748H             | 1864 | MSR_UNC_CBO_4_PERFCTR2    | Package | Uncore C-Box 4, performance counter 2.      |
| 749H             | 1865 | MSR_UNC_CBO_4_PERFCTR3    | Package | Uncore C-Box 4, performance counter 3.      |

### 2.10.2 MSRs In Intel® Xeon® Processor E5 Family (Based on Intel® Microarchitecture Code Name Sandy Bridge)

Table 2-22 lists additional model-specific registers (MSRs) that are specific to the Intel® Xeon® Processor E5 Family (based on Intel® microarchitecture code name Sandy Bridge). These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_2DH, and also supports MSRs listed in Table 2-19 and Table 2-23.

**Table 2-22. Selected MSRs Supported by Intel® Xeon® Processors E5 Family (based on Sandy Bridge microarchitecture)**

| Register Address |     | Register Name         | Scope   | Bit Description   |
|------------------|-----|-----------------------|---------|---|
| Hex              | Dec |                       |         |   |
| 17FH             | 383 | MSR_ERROR_CONTROL     | Package | <b>MC Bank Error Configuration (R/W)</b>  |
|                  |     | 0                     |         | Reserved  |
|                  |     | 1                     |         | <b>MemError Log Enable (R/W)</b><br>When set, enables IMC status bank to log additional info in bits 36:32.       |
|                  |     | 63:2                  |         | Reserved.   |
| 1ADH             | 429 | MSR_TURBO_RATIO_LIMIT | Package | <b>Maximum Ratio Limit of Turbo Mode</b><br>RO if MSR_PLATFORM_INFO.[28] = 0,<br>RW if MSR_PLATFORM_INFO.[28] = 1 |
|                  |     | 7:0                   | Package | <b>Maximum Ratio Limit for 1C</b><br>Maximum turbo ratio limit of 1 core active.                                  |
|                  |     | 15:8                  | Package | <b>Maximum Ratio Limit for 2C</b><br>Maximum turbo ratio limit of 2 core active.                                  |
|                  |     | 23:16                 | Package | <b>Maximum Ratio Limit for 3C</b><br>Maximum turbo ratio limit of 3 core active.                                  |
|                  |     | 31:24                 | Package | <b>Maximum Ratio Limit for 4C</b><br>Maximum turbo ratio limit of 4 core active.                                  |
|                  |     | 39:32                 | Package | <b>Maximum Ratio Limit for 5C</b><br>Maximum turbo ratio limit of 5 core active.                                  |

**Table 2-22. Selected MSRs Supported by Intel® Xeon® Processors E5 Family (based on Sandy Bridge microarchitecture) (Contd.)**

| Register Address |      | Register Name    | Scope   | Bit Description  |
|------------------|------|------------------|---------|--|
| Hex              | Dec  |                  |         |  |
|                  |      | 47:40            | Package | <b>Maximum Ratio Limit for 6C</b><br>Maximum turbo ratio limit of 6 core active.   |
|                  |      | 55:48            | Package | <b>Maximum Ratio Limit for 7C</b><br>Maximum turbo ratio limit of 7 core active.   |
|                  |      | 63:56            | Package | <b>Maximum Ratio Limit for 8C</b><br>Maximum turbo ratio limit of 8 core active.   |
| 285H             | 645  | IA32_MC5_CTL2    | Package | See Table 2-2.   |
| 286H             | 646  | IA32_MC6_CTL2    | Package | See Table 2-2.   |
| 287H             | 647  | IA32_MC7_CTL2    | Package | See Table 2-2.   |
| 288H             | 648  | IA32_MC8_CTL2    | Package | See Table 2-2.   |
| 289H             | 649  | IA32_MC9_CTL2    | Package | See Table 2-2.   |
| 28AH             | 650  | IA32_MC10_CTL2   | Package | See Table 2-2.   |
| 28BH             | 651  | IA32_MC11_CTL2   | Package | See Table 2-2.   |
| 28CH             | 652  | IA32_MC12_CTL2   | Package | See Table 2-2.   |
| 28DH             | 653  | IA32_MC13_CTL2   | Package | See Table 2-2.   |
| 28EH             | 654  | IA32_MC14_CTL2   | Package | See Table 2-2.   |
| 28FH             | 655  | IA32_MC15_CTL2   | Package | See Table 2-2.   |
| 290H             | 656  | IA32_MC16_CTL2   | Package | See Table 2-2.   |
| 291H             | 657  | IA32_MC17_CTL2   | Package | See Table 2-2.   |
| 292H             | 658  | IA32_MC18_CTL2   | Package | See Table 2-2.   |
| 293H             | 659  | IA32_MC19_CTL2   | Package | See Table 2-2.   |
| 39CH             | 924  | MSR_PEBB_NUM_ALT | Package | ENABLE_PEBB_NUM_ALT (Rw)   |
|                  |      | 0                |         | <b>ENABLE_PEBB_NUM_ALT (Rw)</b><br>Write 1 to enable alternate PEBB counting logic for specific events requiring additional configuration, see Table 19-17 |
|                  |      | 63:1             |         | Reserved (must be zero).   |
| 414H             | 1044 | IA32_MC5_CTL     | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."   |
| 415H             | 1045 | IA32_MC5_STATUS  | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs," and Chapter 16.  |
| 416H             | 1046 | IA32_MC5_ADDR    | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."  |
| 417H             | 1047 | IA32_MC5_MISC    | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."  |
| 418H             | 1048 | IA32_MC6_CTL     | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."   |
| 419H             | 1049 | IA32_MC6_STATUS  | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs," and Chapter 16.  |
| 41AH             | 1050 | IA32_MC6_ADDR    | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."  |
| 41BH             | 1051 | IA32_MC6_MISC    | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."  |
| 41CH             | 1052 | IA32_MC7_CTL     | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."   |
| 41DH             | 1053 | IA32_MC7_STATUS  | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRs," and Chapter 16.  |
| 41EH             | 1054 | IA32_MC7_ADDR    | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."  |

**Table 2-22. Selected MSRs Supported by Intel® Xeon® Processors E5 Family (based on Sandy Bridge microarchitecture) (Contd.)**

| Register Address |      | Register Name    | Scope   | Bit Description   |

| 445H             | 1093 | IA32_MC17_STATUS       | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRS," and Chapter 16.                           |
| 446H             | 1094 | IA32_MC17_ADDR         | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."   |
| 447H             | 1095 | IA32_MC17_MISC         | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."   |
| 448H             | 1096 | IA32_MC18_CTL          | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."  |
| 449H             | 1097 | IA32_MC18_STATUS       | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRS," and Chapter 16.                           |
| 44AH             | 1098 | IA32_MC18_ADDR         | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."   |
| 44BH             | 1099 | IA32_MC18_MISC         | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."   |
| 44CH             | 1100 | IA32_MC19_CTL          | Package | See Section 15.3.2.1, "IA32_MCI_CTL MSRs."  |
| 44DH             | 1101 | IA32_MC19_STATUS       | Package | See Section 15.3.2.2, "IA32_MCI_STATUS MSRS," and Chapter 16.                           |
| 44EH             | 1102 | IA32_MC19_ADDR         | Package | See Section 15.3.2.3, "IA32_MCI_ADDR MSRs."   |
| 44FH             | 1103 | IA32_MC19_MISC         | Package | See Section 15.3.2.4, "IA32_MCI_MISC MSRs."   |
| 613H             | 1555 | MSR_PKG_PERF_STATUS    | Package | <b>Package RAPL Perf Status (R/O)</b>   |
| 618H             | 1560 | MSR_DRAM_POWER_LIMIT   | Package | <b>DRAM RAPL Power Limit Control (R/W)</b><br>See Section 14.9.5, "DRAM RAPL Domain."   |
| 619H             | 1561 | MSR_DRAM_ENERGY_STATUS | Package | <b>DRAM Energy Status (R/O)</b><br>See Section 14.9.5, "DRAM RAPL Domain."              |
| 61BH             | 1563 | MSR_DRAM_PERF_STATUS   | Package | <b>DRAM Performance Throttling Status (R/O)</b> See Section 14.9.5, "DRAM RAPL Domain." |
| 61CH             | 1564 | MSR_DRAM_POWER_INFO    | Package | <b>DRAM RAPL Parameters (R/W)</b><br>See Section 14.9.5, "DRAM RAPL Domain."            |
| 639H             | 1593 | MSR_PP0_ENERGY_STATUS  | Package | <b>PP0 Energy Status (R/O)</b><br>See Section 14.9.4, "PP0/PP1 RAPL Domains."           |

See Table 2-19, Table 2-22, and Table 2-23 for MSR definitions applicable to processors with CPUID signature 06\_2DH.

### 2.10.3 Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 Family

Intel Xeon Processor E5 family is based on the Sandy Bridge microarchitecture. The MSR-based uncore PMU interfaces are listed in Table 2-23. For complete detail of the uncore PMU, refer to Intel Xeon Processor E5 Product Family Uncore Performance Monitoring Guide. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_2DH

**Table 2-23. Uncore PMU MSRs in Intel® Xeon® Processor E5 Family**

| Register Address |     | Register Name             | Scope   | Bit Description                         |
|------------------|-----|---------------------------|---------|---|
| Hex              | Dec |                           |         |   |
| C08H             |     | MSR_U_PMON_UCLK_FIXED_CTL | Package | Uncore U-box UCLK fixed counter control |
| C09H             |     | MSR_U_PMON_UCLK_FIXED_CTR | Package | Uncore U-box UCLK fixed counter         |

Table 2-23. Uncore PMU MSRs in Intel® Xeon® Processor E5 Family (Contd.)

| Register Address |     | Register Name           | Scope   | Bit Description  |
|------------------|-----|-------------------------|---------|--|
| Hex              | Dec |                         |         |  |
| C10H             |     | MSR_U_PMON_EVTNSELO     | Package | Uncore U-box perfmon event select for U-box counter 0.     |
| C11H             |     | MSR_U_PMON_EVTNSEL1     | Package | Uncore U-box perfmon event select for U-box counter 1.     |
| C16H             |     | MSR_U_PMON_CTR0         | Package | Uncore U-box perfmon counter 0                             |
| C17H             |     | MSR_U_PMON_CTR1         | Package | Uncore U-box perfmon counter 1                             |
| C24H             |     | MSR_PCU_PMON_BOX_CTL    | Package | Uncore PCU perfmon for PCU-box-wide control                |
| C30H             |     | MSR_PCU_PMON_EVTNSELO   | Package | Uncore PCU perfmon event select for PCU counter 0.         |
| C31H             |     | MSR_PCU_PMON_EVTNSEL1   | Package | Uncore PCU perfmon event select for PCU counter 1.         |
| C32H             |     | MSR_PCU_PMON_EVTNSEL2   | Package | Uncore PCU perfmon event select for PCU counter 2.         |
| C33H             |     | MSR_PCU_PMON_EVTNSEL3   | Package | Uncore PCU perfmon event select for PCU counter 3.         |
| C34H             |     | MSR_PCU_PMON_BOX_FILTER | Package | Uncore PCU perfmon box-wide filter.                        |
| C36H             |     | MSR_PCU_PMON_CTR0       | Package | Uncore PCU perfmon counter 0.                              |
| C37H             |     | MSR_PCU_PMON_CTR1       | Package | Uncore PCU perfmon counter 1.                              |
| C38H             |     | MSR_PCU_PMON_CTR2       | Package | Uncore PCU perfmon counter 2.                              |
| C39H             |     | MSR_PCU_PMON_CTR3       | Package | Uncore PCU perfmon counter 3.                              |
| D04H             |     | MSR_C0_PMON_BOX_CTL     | Package | Uncore C-box 0 perfmon local box wide control.             |
| D10H             |     | MSR_C0_PMON_EVTNSELO    | Package | Uncore C-box 0 perfmon event select for C-box 0 counter 0. |
| D11H             |     | MSR_C0_PMON_EVTNSEL1    | Package | Uncore C-box 0 perfmon event select for C-box 0 counter 1. |
| D12H             |     | MSR_C0_PMON_EVTNSEL2    | Package | Uncore C-box 0 perfmon event select for C-box 0 counter 2. |
| D13H             |     | MSR_C0_PMON_EVTNSEL3    | Package | Uncore C-box 0 perfmon event select for C-box 0 counter 3. |
| D14H             |     | MSR_C0_PMON_BOX_FILTER  | Package | Uncore C-box 0 perfmon box wide filter.                    |
| D16H             |     | MSR_C0_PMON_CTR0        | Package | Uncore C-box 0 perfmon counter 0.                          |
| D17H             |     | MSR_C0_PMON_CTR1        | Package | Uncore C-box 0 perfmon counter 1.                          |
| D18H             |     | MSR_C0_PMON_CTR2        | Package | Uncore C-box 0 perfmon counter 2.                          |
| D19H             |     | MSR_C0_PMON_CTR3        | Package | Uncore C-box 0 perfmon counter 3.                          |
| D24H             |     | MSR_C1_PMON_BOX_CTL     | Package | Uncore C-box 1 perfmon local box wide control.             |
| D30H             |     | MSR_C1_PMON_EVTNSELO    | Package | Uncore C-box 1 perfmon event select for C-box 1 counter 0. |
| D31H             |     | MSR_C1_PMON_EVTNSEL1    | Package | Uncore C-box 1 perfmon event select for C-box 1 counter 1. |
| D32H             |     | MSR_C1_PMON_EVTNSEL2    | Package | Uncore C-box 1 perfmon event select for C-box 1 counter 2. |
| D33H             |     | MSR_C1_PMON_EVTNSEL3    | Package | Uncore C-box 1 perfmon event select for C-box 1 counter 3. |
| D34H             |     | MSR_C1_PMON_BOX_FILTER  | Package | Uncore C-box 1 perfmon box wide filter.                    |
| D36H             |     | MSR_C1_PMON_CTR0        | Package | Uncore C-box 1 perfmon counter 0.                          |
| D37H             |     | MSR_C1_PMON_CTR1        | Package | Uncore C-box 1 perfmon counter 1.                          |
| D38H             |     | MSR_C1_PMON_CTR2        | Package | Uncore C-box 1 perfmon counter 2.                          |
| D39H             |     | MSR_C1_PMON_CTR3        | Package | Uncore C-box 1 perfmon counter 3.                          |
| D44H             |     | MSR_C2_PMON_BOX_CTL     | Package | Uncore C-box 2 perfmon local box wide control.             |
| D50H             |     | MSR_C2_PMON_EVTNSELO    | Package | Uncore C-box 2 perfmon event select for C-box 2 counter 0. |
| D51H             |     | MSR_C2_PMON_EVTNSEL1    | Package | Uncore C-box 2 perfmon event select for C-box 2 counter 1. |

Table 2-23. Uncore PMU MSRs in Intel® Xeon® Processor E5 Family (Contd.)

| Register Address |     | Register Name          | Scope   | Bit Description  |
|------------------|-----|------------------------|---------|--|
| Hex              | Dec |                        |         |  |
| D52H             |     | MSR_C2_PMON_EVTSEL2    | Package | Uncore C-box 2 perfmon event select for C-box 2 counter 2. |
| D53H             |     | MSR_C2_PMON_EVTSEL3    | Package | Uncore C-box 2 perfmon event select for C-box 2 counter 3. |
| D54H             |     | MSR_C2_PMON_BOX_FILTER | Package | Uncore C-box 2 perfmon box wide filter.                    |
| D56H             |     | MSR_C2_PMON_CTR0       | Package | Uncore C-box 2 perfmon counter 0.                          |
| D57H             |     | MSR_C2_PMON_CTR1       | Package | Uncore C-box 2 perfmon counter 1.                          |
| D58H             |     | MSR_C2_PMON_CTR2       | Package | Uncore C-box 2 perfmon counter 2.                          |
| D59H             |     | MSR_C2_PMON_CTR3       | Package | Uncore C-box 2 perfmon counter 3.                          |
| D64H             |     | MSR_C3_PMON_BOX_CTL    | Package | Uncore C-box 3 perfmon local box wide control.             |
| D70H             |     | MSR_C3_PMON_EVTSEL0    | Package | Uncore C-box 3 perfmon event select for C-box 3 counter 0. |
| D71H             |     | MSR_C3_PMON_EVTSEL1    | Package | Uncore C-box 3 perfmon event select for C-box 3 counter 1. |
| D72H             |     | MSR_C3_PMON_EVTSEL2    | Package | Uncore C-box 3 perfmon event select for C-box 3 counter 2. |
| D73H             |     | MSR_C3_PMON_EVTSEL3    | Package | Uncore C-box 3 perfmon event select for C-box 3 counter 3. |
| D74H             |     | MSR_C3_PMON_BOX_FILTER | Package | Uncore C-box 3 perfmon box wide filter.                    |
| D76H             |     | MSR_C3_PMON_CTR0       | Package | Uncore C-box 3 perfmon counter 0.                          |
| D77H             |     | MSR_C3_PMON_CTR1       | Package | Uncore C-box 3 perfmon counter 1.                          |
| D78H             |     | MSR_C3_PMON_CTR2       | Package | Uncore C-box 3 perfmon counter 2.                          |
| D79H             |     | MSR_C3_PMON_CTR3       | Package | Uncore C-box 3 perfmon counter 3.                          |
| D84H             |     | MSR_C4_PMON_BOX_CTL    | Package | Uncore C-box 4 perfmon local box wide control.             |
| D90H             |     | MSR_C4_PMON_EVTSEL0    | Package | Uncore C-box 4 perfmon event select for C-box 4 counter 0. |
| D91H             |     | MSR_C4_PMON_EVTSEL1    | Package | Uncore C-box 4 perfmon event select for C-box 4 counter 1. |
| D92H             |     | MSR_C4_PMON_EVTSEL2    | Package | Uncore C-box 4 perfmon event select for C-box 4 counter 2. |
| D93H             |     | MSR_C4_PMON_EVTSEL3    | Package | Uncore C-box 4 perfmon event select for C-box 4 counter 3. |
| D94H             |     | MSR_C4_PMON_BOX_FILTER | Package | Uncore C-box 4 perfmon box wide filter.                    |
| D96H             |     | MSR_C4_PMON_CTR0       | Package | Uncore C-box 4 perfmon counter 0.                          |
| D97H             |     | MSR_C4_PMON_CTR1       | Package | Uncore C-box 4 perfmon counter 1.                          |
| D98H             |     | MSR_C4_PMON_CTR2       | Package | Uncore C-box 4 perfmon counter 2.                          |
| D99H             |     | MSR_C4_PMON_CTR3       | Package | Uncore C-box 4 perfmon counter 3.                          |
| DA4H             |     | MSR_C5_PMON_BOX_CTL    | Package | Uncore C-box 5 perfmon local box wide control.             |
| DB0H             |     | MSR_C5_PMON_EVTSEL0    | Package | Uncore C-box 5 perfmon event select for C-box 5 counter 0. |
| DB1H             |     | MSR_C5_PMON_EVTSEL1    | Package | Uncore C-box 5 perfmon event select for C-box 5 counter 1. |
| DB2H             |     | MSR_C5_PMON_EVTSEL2    | Package | Uncore C-box 5 perfmon event select for C-box 5 counter 2. |
| DB3H             |     | MSR_C5_PMON_EVTSEL3    | Package | Uncore C-box 5 perfmon event select for C-box 5 counter 3. |
| DB4H             |     | MSR_C5_PMON_BOX_FILTER | Package | Uncore C-box 5 perfmon box wide filter.                    |
| DB6H             |     | MSR_C5_PMON_CTR0       | Package | Uncore C-box 5 perfmon counter 0.                          |
| DB7H             |     | MSR_C5_PMON_CTR1       | Package | Uncore C-box 5 perfmon counter 1.                          |
| DB8H             |     | MSR_C5_PMON_CTR2       | Package | Uncore C-box 5 perfmon counter 2.                          |
| DB9H             |     | MSR_C5_PMON_CTR3       | Package | Uncore C-box 5 perfmon counter 3.                          |

| DF9H             |     | MSR_C7_PMON_CTR3       | Package | Uncore C-box 7 perfmon counter 3.                          |

## 2.11 MSRS IN THE 3RD GENERATION INTEL® CORE™ PROCESSOR FAMILY (BASED ON INTEL® MICROARCHITECTURE CODE NAME IVY BRIDGE)

The 3rd generation Intel® Core™ processor family and the Intel® Xeon® processor E3-1200v2 product family (based on Intel microarchitecture code name Ivy Bridge) support the MSR interfaces listed in Table 2-19, Table 2-20, Table 2-21, and Table 2-24. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_3AH.

**Table 2-24. Additional MSRs Supported by 3rd Generation Intel® Core™ Processors (based on Intel® microarchitecture code name Ivy Bridge)**

| Register Address |     | Register Name     | Scope   | Bit Description  |
|------------------|-----|-------------------|---------|--|
| Hex              | Dec |                   |         |  |
| CEH              | 206 | MSR_PLATFORM_INFO | Package | Platform Information; contains power management and other model specific features enumeration. See <a href="http://biosbits.org">http://biosbits.org</a> . |
|                  |     | 7:0               |         | Reserved.  |

**Table 2-24. Additional MSRs Supported by 3rd Generation Intel® Core™ Processors (based on Intel® microarchitecture code name Ivy Bridge) (Contd.)**

| Register Address |     | Register Name              | Scope   | Bit Description  |
|------------------|-----|----------------------------|---------|--|
| Hex              | Dec |                            |         |  |
|                  |     | 15:8                       | Package | <b>Maximum Non-Turbo Ratio (R/O)</b><br>The is the ratio of the frequency that invariant TSC runs at.<br>Frequency = ratio * 100 MHz.  |
|                  |     | 27:16                      |         | Reserved.  |
|                  |     | 28                         | Package | <b>Programmable Ratio Limit for Turbo Mode (R/O)</b><br>When set to 1, indicates that Programmable Ratio Limits for Turbo mode is enabled, and when set to 0, indicates Programmable Ratio Limits for Turbo mode is disabled.                  |
|                  |     | 29                         | Package | <b>Programmable TDP Limit for Turbo Mode (R/O)</b><br>When set to 1, indicates that TDP Limits for Turbo mode are programmable, and when set to 0, indicates TDP Limit for Turbo mode is not programmable.                                     |
|                  |     | 31:30                      |         | Reserved.  |
|                  |     | 32                         | Package | <b>Low Power Mode Support (LPM) (R/O)</b><br>When set to 1, indicates that LPM is supported, and when set to 0, indicates LPM is not supported.  |
|                  |     | 34:33                      | Package | <b>Number of ConfigTDP Levels (R/O)</b><br>00: Only Base TDP level available.<br>01: One additional TDP level available.<br>02: Two additional TDP level available.<br>11: Reserved  |
|                  |     | 39:35                      |         | Reserved.  |
|                  |     | 47:40                      | Package | <b>Maximum Efficiency Ratio (R/O)</b><br>The is the minimum ratio (maximum efficiency) that the processor can operates, in units of 100MHz.  |
|                  |     | 55:48                      | Package | <b>Minimum Operating Ratio (R/O)</b><br>Contains the minimum supported operating ratio in units of 100 MHz.  |
|                  |     | 63:56                      |         | Reserved.  |
| E2H              | 226 | MSR_PKG_CST_CONFIG_CONTROL | Core    | <b>C-State Configuration Control (R/W)</b><br>Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-States.<br>See <a href="http://biosbits.org">http://biosbits.org</a> . |

**Table 2-24. Additional MSRs Supported by 3rd Generation Intel® Core™ Processors (based on Intel® microarchitecture code name Ivy Bridge) (Contd.)**

### 2.11.1 MSRs In Intel® Xeon® Processor E5 v2 Product Family (Based on Ivy Bridge-E Microarchitecture)

Table 2-25 lists model-specific registers (MSRs) that are specific to the Intel® Xeon® Processor E5 v2 Product Family (based on Ivy Bridge-E microarchitecture). These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_3EH, see Table 2-1. These processors supports the MSR interfaces listed in Table 2-19, and Table 2-25.

**Table 2-25. MSRs Supported by Intel® Xeon® Processors E5 v2 Product Family (based on Ivy Bridge-E microarchitecture)**

| Register Address |     | Register Name | Scope   | Bit Description  |
|------------------|-----|---------------|---------|--|
| Hex              | Dec |               |         |  |
| 4EH              | 78  | MSR_PPIN_CTL  | Package | Protected Processor Inventory Number Enable Control (R/W)  |
|                  |     | 0             |         | LockOut (R/WO)<br>Set 1 to prevent further writes to MSR_PPIN_CTL. Writing 1 to MSR_PPIN_CTL[bit 0] is permitted only if MSR_PPIN_CTL[bit 1] is clear, Default is 0.<br>BIOS should provide an opt-in menu to enable the user to turn on MSR_PPIN_CTL[bit 1] for privileged inventory initialization agent to access MSR_PPIN. After reading MSR_PPIN, the privileged inventory initialization agent should write '01b' to MSR_PPIN_CTL to disable further access to MSR_PPIN and prevent unauthorized modification to MSR_PPIN_CTL. |
|                  |     | 1             |         | Enable_PPIN (R/W)<br>If 1, enables MSR_PPIN to be accessible using RDMSR. Once set, attempt to write 1 to MSR_PPIN_CTL[bit 0] will cause #GP.<br>If 0, an attempt to read MSR_PPIN will cause #GP. Default is 0.   |

### 2.11.2 Additional MSRs Supported by Intel® Xeon® Processor E7 v2 Family

Intel® Xeon® processor E7 v2 family (based on Ivy Bridge-E microarchitecture) with CPUID DisplayFamily\_DisplayModel signature 06\_3EH supports the MSR interfaces listed in Table 2-19, Table 2-25, and Table 2-26.

**Table 2-26. Additional MSRs Supported by Intel® Xeon® Processor E7 v2 Family with DisplayFamily\_DisplayModel Signature 06\_3EH**

| Register Address |     | Register Name        | Scope  | Bit Description   |

See Table 2-19, Table 2-25 for other MSR definitions applicable to Intel Xeon processor E7 v2 with CPUID signature 06\_3AH.

**NOTES:**

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

### 2.11.3 Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 v2 and E7 v2 Families

Intel Xeon Processor E5 v2 and E7 v2 families are based on the Ivy Bridge-E microarchitecture. The MSR-based uncore PMU interfaces are listed in Table 2-23 and Table 2-27. For complete detail of the uncore PMU, refer to Intel Xeon Processor E5 v2 Product Family Uncore Performance Monitoring Guide. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_3EH.

**Table 2-27. Uncore PMU MSRs in Intel® Xeon® Processor E5 v2 and E7 v2 Families**

| Register Address |     | Register Name           | Scope   | Bit Description  |
|------------------|-----|-------------------------|---------|--|
| Hex              | Dec |                         |         |  |
| C00H             |     | MSR_PMON_GLOBAL_CTL     | Package | Uncore perfmon per-socket global control.                  |
| C01H             |     | MSR_PMON_GLOBAL_STATUS  | Package | Uncore perfmon per-socket global status.                   |
| C06H             |     | MSR_PMON_GLOBAL_CONFIG  | Package | Uncore perfmon per-socket global configuration.            |
| C15H             |     | MSR_U_PMON_BOX_STATUS   | Package | Uncore U-box perfmon U-box wide status.                    |
| C35H             |     | MSR_PCU_PMON_BOX_STATUS | Package | Uncore PCU perfmon box wide status.                        |
| D1AH             |     | MSR_C0_PMON_BOX_FILTER1 | Package | Uncore C-box 0 perfmon box wide filter1.                   |
| D3AH             |     | MSR_C1_PMON_BOX_FILTER1 | Package | Uncore C-box 1 perfmon box wide filter1.                   |
| D5AH             |     | MSR_C2_PMON_BOX_FILTER1 | Package | Uncore C-box 2 perfmon box wide filter1.                   |
| D7AH             |     | MSR_C3_PMON_BOX_FILTER1 | Package | Uncore C-box 3 perfmon box wide filter1.                   |
| D9AH             |     | MSR_C4_PMON_BOX_FILTER1 | Package | Uncore C-box 4 perfmon box wide filter1.                   |
| DBAH             |     | MSR_C5_PMON_BOX_FILTER1 | Package | Uncore C-box 5 perfmon box wide filter1.                   |
| DDAH             |     | MSR_C6_PMON_BOX_FILTER1 | Package | Uncore C-box 6 perfmon box wide filter1.                   |
| DFAH             |     | MSR_C7_PMON_BOX_FILTER1 | Package | Uncore C-box 7 perfmon box wide filter1.                   |
| E04H             |     | MSR_C8_PMON_BOX_CTL     | Package | Uncore C-box 8 perfmon local box wide control.             |
| E10H             |     | MSR_C8_PMON_EVNTSEL0    | Package | Uncore C-box 8 perfmon event select for C-box 8 counter 0. |
| E11H             |     | MSR_C8_PMON_EVNTSEL1    | Package | Uncore C-box 8 perfmon event select for C-box 8 counter 1. |
| E12H             |     | MSR_C8_PMON_EVNTSEL2    | Package | Uncore C-box 8 perfmon event select for C-box 8 counter 2. |
| E13H             |     | MSR_C8_PMON_EVNTSEL3    | Package | Uncore C-box 8 perfmon event select for C-box 8 counter 3. |
| E14H             |     | MSR_C8_PMON_BOX_FILTER  | Package | Uncore C-box 8 perfmon box wide filter.                    |
| E16H             |     | MSR_C8_PMON_CTR0        | Package | Uncore C-box 8 perfmon counter 0.                          |
| E17H             |     | MSR_C8_PMON_CTR1        | Package | Uncore C-box 8 perfmon counter 1.                          |
| E18H             |     | MSR_C8_PMON_CTR2        | Package | Uncore C-box 8 perfmon counter 2.                          |
| E19H             |     | MSR_C8_PMON_CTR3        | Package | Uncore C-box 8 perfmon counter 3.                          |
| E1AH             |     | MSR_C8_PMON_BOX_FILTER1 | Package | Uncore C-box 8 perfmon box wide filter1.                   |
| E24H             |     | MSR_C9_PMON_BOX_CTL     | Package | Uncore C-box 9 perfmon local box wide control.             |
| E30H             |     | MSR_C9_PMON_EVNTSEL0    | Package | Uncore C-box 9 perfmon event select for C-box 9 counter 0. |
| E31H             |     | MSR_C9_PMON_EVNTSEL1    | Package | Uncore C-box 9 perfmon event select for C-box 9 counter 1. |
| E32H             |     | MSR_C9_PMON_EVNTSEL2    | Package | Uncore C-box 9 perfmon event select for C-box 9 counter 2. |
| E33H             |     | MSR_C9_PMON_EVNTSEL3    | Package | Uncore C-box 9 perfmon event select for C-box 9 counter 3. |
| E34H             |     | MSR_C9_PMON_BOX_FILTER  | Package | Uncore C-box 9 perfmon box wide filter.                    |
| E36H             |     | MSR_C9_PMON_CTR0        | Package | Uncore C-box 9 perfmon counter 0.                          |
| E37H             |     | MSR_C9_PMON_CTR1        | Package | Uncore C-box 9 perfmon counter 1.                          |

**Table 2-27. Uncore PMU MSRs in Intel® Xeon® Processor E5 v2 and E7 v2 Families (Contd.)**

| Register Address |     | Register Name            | Scope   | Bit Description  |
|------------------|-----|--------------------------|---------|--|
| Hex              | Dec |                          |         |  |
| E38H             |     | MSR_C9_PMON_CTR2         | Package | Uncore C-box 9 perfmon counter 2.                            |
| E39H             |     | MSR_C9_PMON_CTR3         | Package | Uncore C-box 9 perfmon counter 3.                            |
| E3AH             |     | MSR_C9_PMON_BOX_FILTER1  | Package | Uncore C-box 9 perfmon box wide filter1.                     |
| E44H             |     | MSR_C10_PMON_BOX_CTL     | Package | Uncore C-box 10 perfmon local box wide control.              |
| E50H             |     | MSR_C10_PMON_EVNTSEL0    | Package | Uncore C-box 10 perfmon event select for C-box 10 counter 0. |
| E51H             |     | MSR_C10_PMON_EVNTSEL1    | Package | Uncore C-box 10 perfmon event select for C-box 10 counter 1. |
| E52H             |     | MSR_C10_PMON_EVNTSEL2    | Package | Uncore C-box 10 perfmon event select for C-box 10 counter 2. |
| E53H             |     | MSR_C10_PMON_EVNTSEL3    | Package | Uncore C-box 10 perfmon event select for C-box 10 counter 3. |
| E54H             |     | MSR_C10_PMON_BOX_FILTER  | Package | Uncore C-box 10 perfmon box wide filter.                     |
| E56H             |     | MSR_C10_PMON_CTR0        | Package | Uncore C-box 10 perfmon counter 0.                           |
| E57H             |     | MSR_C10_PMON_CTR1        | Package | Uncore C-box 10 perfmon counter 1.                           |
| E58H             |     | MSR_C10_PMON_CTR2        | Package | Uncore C-box 10 perfmon counter 2.                           |
| E59H             |     | MSR_C10_PMON_CTR3        | Package | Uncore C-box 10 perfmon counter 3.                           |
| E5AH             |     | MSR_C10_PMON_BOX_FILTER1 | Package | Uncore C-box 10 perfmon box wide filter1.                    |
| E64H             |     | MSR_C11_PMON_BOX_CTL     | Package | Uncore C-box 11 perfmon local box wide control.              |
| E70H             |     | MSR_C11_PMON_EVNTSEL0    | Package | Uncore C-box 11 perfmon event select for C-box 11 counter 0. |
| E71H             |     | MSR_C11_PMON_EVNTSEL1    | Package | Uncore C-box 11 perfmon event select for C-box 11 counter 1. |
| E72H             |     | MSR_C11_PMON_EVNTSEL2    | Package | Uncore C-box 11 perfmon event select for C-box 11 counter 2. |
| E73H             |     | MSR_C11_PMON_EVNTSEL3    | Package | Uncore C-box 11 perfmon event select for C-box 11 counter 3. |
| E74H             |     | MSR_C11_PMON_BOX_FILTER  | Package | Uncore C-box 11 perfmon box wide filter.                     |
| E76H             |     | MSR_C11_PMON_CTR0        | Package | Uncore C-box 11 perfmon counter 0.                           |
| E77H             |     | MSR_C11_PMON_CTR1        | Package | Uncore C-box 11 perfmon counter 1.                           |
| E78H             |     | MSR_C11_PMON_CTR2        | Package | Uncore C-box 11 perfmon counter 2.                           |
| E79H             |     | MSR_C11_PMON_CTR3        | Package | Uncore C-box 11 perfmon counter 3.                           |
| E7AH             |     | MSR_C11_PMON_BOX_FILTER1 | Package | Uncore C-box 11 perfmon box wide filter1.                    |
| E84H             |     | MSR_C12_PMON_BOX_CTL     | Package | Uncore C-box 12 perfmon local box wide control.              |
| E90H             |     | MSR_C12_PMON_EVNTSEL0    | Package | Uncore C-box 12 perfmon event select for C-box 12 counter 0. |
| E91H             |     | MSR_C12_PMON_EVNTSEL1    | Package | Uncore C-box 12 perfmon event select for C-box 12 counter 1. |
| E92H             |     | MSR_C12_PMON_EVNTSEL2    | Package | Uncore C-box 12 perfmon event select for C-box 12 counter 2. |
| E93H             |     | MSR_C12_PMON_EVNTSEL3    | Package | Uncore C-box 12 perfmon event select for C-box 12 counter 3. |
| E94H             |     | MSR_C12_PMON_BOX_FILTER  | Package | Uncore C-box 12 perfmon box wide filter.                     |
| E96H             |     | MSR_C12_PMON_CTR0        | Package | Uncore C-box 12 perfmon counter 0.                           |
| E97H             |     | MSR_C12_PMON_CTR1        | Package | Uncore C-box 12 perfmon counter 1.                           |
| E98H             |     | MSR_C12_PMON_CTR2        | Package | Uncore C-box 12 perfmon counter 2.                           |
| E99H             |     | MSR_C12_PMON_CTR3        | Package | Uncore C-box 12 perfmon counter 3.                           |
| E9AH             |     | MSR_C12_PMON_BOX_FILTER1 | Package | Uncore C-box 12 perfmon box wide filter1.                    |
| EA4H             |     | MSR_C13_PMON_BOX_CTL     | Package | Uncore C-box 13 perfmon local box wide control.              |

| Register Address |     | Register Name            | Scope   | Bit Description  |
|------------------|-----|--------------------------|---------|--|
| Hex              | Dec |                          |         |  |
| EB0H             |     | MSR_C13_PMON_EVNTSEL0    | Package | Uncore C-box 13 perfmon event select for C-box 13 counter 0. |
| EB1H             |     | MSR_C13_PMON_EVNTSEL1    | Package | Uncore C-box 13 perfmon event select for C-box 13 counter 1. |
| EB2H             |     | MSR_C13_PMON_EVNTSEL2    | Package | Uncore C-box 13 perfmon event select for C-box 13 counter 2. |
| EB3H             |     | MSR_C13_PMON_EVNTSEL3    | Package | Uncore C-box 13 perfmon event select for C-box 13 counter 3. |
| EB4H             |     | MSR_C13_PMON_BOX_FILTER  | Package | Uncore C-box 13 perfmon box wide filter.                     |
| EB6H             |     | MSR_C13_PMON_CTR0        | Package | Uncore C-box 13 perfmon counter 0.                           |
| EB7H             |     | MSR_C13_PMON_CTR1        | Package | Uncore C-box 13 perfmon counter 1.                           |
| EB8H             |     | MSR_C13_PMON_CTR2        | Package | Uncore C-box 13 perfmon counter 2.                           |
| EB9H             |     | MSR_C13_PMON_CTR3        | Package | Uncore C-box 13 perfmon counter 3.                           |
| EBAH             |     | MSR_C13_PMON_BOX_FILTER1 | Package | Uncore C-box 13 perfmon box wide filter1.                    |
| EC4H             |     | MSR_C14_PMON_BOX_CTL     | Package | Uncore C-box 14 perfmon local box wide control.              |
| ED0H             |     | MSR_C14_PMON_EVNTSEL0    | Package | Uncore C-box 14 perfmon event select for C-box 14 counter 0. |
| ED1H             |     | MSR_C14_PMON_EVNTSEL1    | Package | Uncore C-box 14 perfmon event select for C-box 14 counter 1. |
| ED2H             |     | MSR_C14_PMON_EVNTSEL2    | Package | Uncore C-box 14 perfmon event select for C-box 14 counter 2. |
| ED3H             |     | MSR_C14_PMON_EVNTSEL3    | Package | Uncore C-box 14 perfmon event select for C-box 14 counter 3. |
| ED4H             |     | MSR_C14_PMON_BOX_FILTER  | Package | Uncore C-box 14 perfmon box wide filter.                     |
| ED6H             |     | MSR_C14_PMON_CTR0        | Package | Uncore C-box 14 perfmon counter 0.                           |
| ED7H             |     | MSR_C14_PMON_CTR1        | Package | Uncore C-box 14 perfmon counter 1.                           |
| ED8H             |     | MSR_C14_PMON_CTR2        | Package | Uncore C-box 14 perfmon counter 2.                           |
| ED9H             |     | MSR_C14_PMON_CTR3        | Package | Uncore C-box 14 perfmon counter 3.                           |
| EDAH             |     | MSR_C14_PMON_BOX_FILTER1 | Package | Uncore C-box 14 perfmon box wide filter1.                    |

## 2.12 MSRS IN THE 4TH GENERATION INTEL® CORE™ PROCESSORS (BASED ON HASWELL MICROARCHITECTURE)

The 4th generation Intel® Core™ processor family and Intel® Xeon® processor E3-1200v3 product family (based on Haswell microarchitecture), with CUID DisplayFamily\_DisplayModel signature 06\_3CH/06\_45H/06\_46H, support the MSR interfaces listed in Table 2-19, Table 2-20, Table 2-21, and Table 2-28. For an MSR listed in Table 2-19 that also appears in Table 2-28, Table 2-28 supercede Table 2-19.

The MSRs listed in Table 2-28 also apply to processors based on Haswell-E microarchitecture (see Section 2.13).

**Table 2-28. Additional MSRs Supported by Processors based on the Haswell or Haswell-E microarchitectures**

| Register Address |     | Register Name     | Scope   | Bit Description  |
|------------------|-----|-------------------|---------|--|
| Hex              | Dec |                   |         |  |
| 3BH              | 59  | IA32_TSC_ADJUST   | THREAD  | <b>Per-Logical-Processor TSC ADJUST (R/W)</b><br>See Table 2-2.  |
| CEH              | 206 | MSR_PLATFORM_INFO | Package | Platform Information; contains power management and other model specific features enumeration. See <a href="http://biosbits.org">http://biosbits.org</a> . |

**Table 2-28. Additional MSRs Supported by Processors based on the Haswell or Haswell-E microarchitectures**

| Register Address |     | Register Name    | Scope   | Bit Description   |
|------------------|-----|------------------|---------|---|
| Hex              | Dec |                  |         |   |
|                  |     | 7:0              |         | Reserved.   |
|                  |     | 15:8             | Package | <b>Maximum Non-Turbo Ratio (R/O)</b><br>The is the ratio of the frequency that invariant TSC runs at.<br>Frequency = ratio * 100 MHz.   |
|                  |     | 27:16            |         | Reserved.   |
|                  |     | 28               | Package | <b>Programmable Ratio Limit for Turbo Mode (R/O)</b><br>When set to 1, indicates that Programmable Ratio Limits for Turbo mode is enabled, and when set to 0, indicates Programmable Ratio Limits for Turbo mode is disabled. |
|                  |     | 29               | Package | <b>Programmable TDP Limit for Turbo Mode (R/O)</b><br>When set to 1, indicates that TDP Limits for Turbo mode are programmable, and when set to 0, indicates TDP Limit for Turbo mode is not programmable.                    |
|                  |     | 31:30            |         | Reserved.   |
|                  |     | 32               | Package | <b>Low Power Mode Support (LPM) (R/O)</b><br>When set to 1, indicates that LPM is supported, and when set to 0, indicates LPM is not supported.   |
|                  |     | 34:33            | Package | <b>Number of ConfigTDP Levels (R/O)</b><br>00: Only Base TDP level available.<br>01: One additional TDP level available.<br>02: Two additional TDP level available.<br>11: Reserved   |
|                  |     | 39:35            |         | Reserved.   |
|                  |     | 47:40            | Package | <b>Maximum Efficiency Ratio (R/O)</b><br>The is the minimum ratio (maximum efficiency) that the processor can operates, in units of 100MHz.   |
|                  |     | 55:48            | Package | <b>Minimum Operating Ratio (R/O)</b><br>Contains the minimum supported operating ratio in units of 100 MHz.   |
|                  |     | 63:56            |         | Reserved.   |
| 186H             | 390 | IA32_PERFEVTSELO | THREAD  | <b>Performance Event Select for Counter 0 (R/W)</b><br>Supports all fields described inTable 2-2 and the fields below.  |
|                  |     | 32               |         | IN_TX: see Section 18.3.6.5.1<br>When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results  |
| 187H             | 391 | IA32_PERFEVTSEL1 | THREAD  | <b>Performance Event Select for Counter 1 (R/W)</b><br>Supports all fields described inTable 2-2 and the fields below.  |
|                  |     | 32               |         | IN_TX: see Section 18.3.6.5.1<br>When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results  |
| 188H             | 392 | IA32_PERFEVTSEL2 | THREAD  | <b>Performance Event Select for Counter 2 (R/W)</b><br>Supports all fields described inTable 2-2 and the fields below.  |

**Table 2-28. Additional MSRs Supported by Processors based on the Haswell or Haswell-E microarchitectures**

| Register Address |     | Register Name   | Scope  | Bit Description  |
|------------------|-----|-----------------|--------|--|
| Hex              | Dec |                 |        |  |
|                  |     | 32              |        | IN_TX: see Section 18.3.6.5.1<br>When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results   |
|                  |     | 33              |        | IN_TXCP: see Section 18.3.6.5.1<br>When IN_TXCP=1 & IN_TX=1 and in sampling, spurious PMI may occur and transactions may continuously abort near overflow conditions. Software should favor using IN_TXCP for counting over sampling. If sampling, software should use large “sample-after” value after clearing the counter configured to use IN_TXCP and also always reset the counter even when no overflow condition was reported. |
| 189H             | 393 | IA32_PERFVTSEL3 | THREAD | <b>Performance Event Select for Counter 3 (R/W)</b><br>Supports all fields described in Table 2-2 and the fields below.  |
|                  |     | 32              |        | IN_TX: see Section 18.3.6.5.1<br>When IN_TX (bit 32) is set, AnyThread (bit 21) should be cleared to prevent incorrect results   |
| 1C8H             | 456 | MSR_LBR_SELECT  | Thread | <b>Last Branch Record Filtering Select Register (R/W)</b>  |
|                  |     | 0               |        | CPL_EQ_0   |
|                  |     | 1               |        | CPL_NEQ_0  |
|                  |     | 2               |        | JCC  |

### 2.12.1 MSRs in 4th Generation Intel® Core™ Processor Family (based on Haswell Microarchitecture)

Table 2-29 lists model-specific registers (MSRs) that are specific to 4th generation Intel® Core™ processor family and Intel® Xeon® processor E3-1200 v3 product family (based on Haswell microarchitecture). These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_3CH/06\_45H/06\_46H, see Table 2-1.

**Table 2-29. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell microarchitecture)**

| Register Address |     | Register Name              | Scope | Bit Description  |
|------------------|-----|----------------------------|-------|--|
| Hex              | Dec |                            |       |  |
| E2H              | 226 | MSR_PKG_CST_CONFIG_CONTROL | Core  | <b>C-State Configuration Control (R/W)</b><br>Note: C-state values are processor specific C-state code names, unrelated to MWAIT extension C-state parameters or ACPI C-states.<br>See <a href="http://biosbits.org">http://biosbits.org</a> . |

Table 2-29. MSRs Supported by 4th Generation Intel® Core™ Processors (Haswell microarchitecture) (Contd.)

| Register Address |     | Register Name         | Scope   | Bit Description   |
|------------------|-----|-----------------------|---------|---|
| Hex              | Dec |                       |         |   |
|                  |     | 3:0                   |         | <b>Package C-State Limit (R/W)</b><br>Specifies the lowest processor-specific C-state code name (consuming the least power) for the package. The default is set as factory-configured package C-state limit.<br>The following C-state code name encodings are supported:<br>0000b: C0/C1 (no package C-state support)<br>0001b: C2<br>0010b: C3<br>0011b: C6<br>0100b: C7<br>0101b: C7s<br>Package C states C7 are not available to processor with signature 06_3CH |
|                  |     | 9:4                   |         | Reserved  |

See Table 2-19, Table 2-28 for other MSR definitions applicable to processors with CPUID signature 06\_3FH.

**NOTES:**

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

**2.13.1 Additional Uncore PMU MSRs in the Intel® Xeon® Processor E5 v3 Family**

Intel Xeon Processor E5 v3 and E7 v3 family are based on the Haswell-E microarchitecture. The MSR-based uncore PMU interfaces are listed in Table 2-32. For complete detail of the uncore PMU, refer to Intel Xeon Processor E5 v3 Product Family Uncore Performance Monitoring Guide. These processors have a CPUID signature with DisplayFamily\_DisplayModel of 06\_3FH.

**Table 2-32. Uncore PMU MSRs in Intel® Xeon® Processor E5 v3 Family**

| Register Address |     | Register Name             | Scope   | Bit Description                                 |

| 714H             |     | MSR_PCU_PMON_EVNTSEL3   | Package | Uncore PCU perfmon event select for PCU counter 3.     |
| 715H             |     | MSR_PCU_PMON_BOX_FILTER | Package | Uncore PCU perfmon box-wide filter.                    |
| 716H             |     | MSR_PCU_PMON_BOX_STATUS | Package | Uncore PCU perfmon box wide status.                    |
| 717H             |     | MSR_PCU_PMON_CTR0       | Package | Uncore PCU perfmon counter 0.                          |
| 718H             |     | MSR_PCU_PMON_CTR1       | Package | Uncore PCU perfmon counter 1.                          |
| 719H             |     | MSR_PCU_PMON_CTR2       | Package | Uncore PCU perfmon counter 2.                          |
| 71AH             |     | MSR_PCU_PMON_CTR3       | Package | Uncore PCU perfmon counter 3.                          |
| 720H             |     | MSR_S0_PMON_BOX_CTL     | Package | Uncore SBo 0 perfmon for SBo 0 box-wide control        |
| 721H             |     | MSR_S0_PMON_EVNTSEL0    | Package | Uncore SBo 0 perfmon event select for SBo 0 counter 0. |
| 722H             |     | MSR_S0_PMON_EVNTSEL1    | Package | Uncore SBo 0 perfmon event select for SBo 0 counter 1. |
| 723H             |     | MSR_S0_PMON_EVNTSEL2    | Package | Uncore SBo 0 perfmon event select for SBo 0 counter 2. |
| 724H             |     | MSR_S0_PMON_EVNTSEL3    | Package | Uncore SBo 0 perfmon event select for SBo 0 counter 3. |
| 725H             |     | MSR_S0_PMON_BOX_FILTER  | Package | Uncore SBo 0 perfmon box-wide filter.                  |
| 726H             |     | MSR_S0_PMON_CTR0        | Package | Uncore SBo 0 perfmon counter 0.                        |
| 727H             |     | MSR_S0_PMON_CTR1        | Package | Uncore SBo 0 perfmon counter 1.                        |
| 728H             |     | MSR_S0_PMON_CTR2        | Package | Uncore SBo 0 perfmon counter 2.                        |
| 729H             |     | MSR_S0_PMON_CTR3        | Package | Uncore SBo 0 perfmon counter 3.                        |
| 72AH             |     | MSR_S1_PMON_BOX_CTL     | Package | Uncore SBo 1 perfmon for SBo 1 box-wide control        |
| 72BH             |     | MSR_S1_PMON_EVNTSEL0    | Package | Uncore SBo 1 perfmon event select for SBo 1 counter 0. |
| 72CH             |     | MSR_S1_PMON_EVNTSEL1    | Package | Uncore SBo 1 perfmon event select for SBo 1 counter 1. |
| 72DH             |     | MSR_S1_PMON_EVNTSEL2    | Package | Uncore SBo 1 perfmon event select for SBo 1 counter 2. |
| 72EH             |     | MSR_S1_PMON_EVNTSEL3    | Package | Uncore SBo 1 perfmon event select for SBo 1 counter 3. |
| 72FH             |     | MSR_S1_PMON_BOX_FILTER  | Package | Uncore SBo 1 perfmon box-wide filter.                  |
| 730H             |     | MSR_S1_PMON_CTR0        | Package | Uncore SBo 1 perfmon counter 0.                        |
| 731H             |     | MSR_S1_PMON_CTR1        | Package | Uncore SBo 1 perfmon counter 1.                        |
| 732H             |     | MSR_S1_PMON_CTR2        | Package | Uncore SBo 1 perfmon counter 2.                        |
| 733H             |     | MSR_S1_PMON_CTR3        | Package | Uncore SBo 1 perfmon counter 3.                        |
| 734H             |     | MSR_S2_PMON_BOX_CTL     | Package | Uncore SBo 2 perfmon for SBo 2 box-wide control        |

Table 2-32. Uncore PMU MSRs in Intel® Xeon® Processor E5 v3 Family (Contd.)

| Register Address |     | Register Name           | Scope   | Bit Description  |
|------------------|-----|-------------------------|---------|--|
| Hex              | Dec |                         |         |  |
| 735H             |     | MSR_S2_PMON_EVTSEL0     | Package | Uncore SBo 2 perfmon event select for SBo 2 counter 0.     |
| 736H             |     | MSR_S2_PMON_EVTSEL1     | Package | Uncore SBo 2 perfmon event select for SBo 2 counter 1.     |
| 737H             |     | MSR_S2_PMON_EVTSEL2     | Package | Uncore SBo 2 perfmon event select for SBo 2 counter 2.     |
| 738H             |     | MSR_S2_PMON_EVTSEL3     | Package | Uncore SBo 2 perfmon event select for SBo 2 counter 3.     |
| 739H             |     | MSR_S2_PMON_BOX_FILTER  | Package | Uncore SBo 2 perfmon box-wide filter.                      |
| 73AH             |     | MSR_S2_PMON_CTR0        | Package | Uncore SBo 2 perfmon counter 0.                            |
| 73BH             |     | MSR_S2_PMON_CTR1        | Package | Uncore SBo 2 perfmon counter 1.                            |
| 73CH             |     | MSR_S2_PMON_CTR2        | Package | Uncore SBo 2 perfmon counter 2.                            |
| 73DH             |     | MSR_S2_PMON_CTR3        | Package | Uncore SBo 2 perfmon counter 3.                            |
| 73EH             |     | MSR_S3_PMON_BOX_CTL     | Package | Uncore SBo 3 perfmon for SBo 3 box-wide control            |
| 73FH             |     | MSR_S3_PMON_EVTSEL0     | Package | Uncore SBo 3 perfmon event select for SBo 3 counter 0.     |
| 740H             |     | MSR_S3_PMON_EVTSEL1     | Package | Uncore SBo 3 perfmon event select for SBo 3 counter 1.     |
| 741H             |     | MSR_S3_PMON_EVTSEL2     | Package | Uncore SBo 3 perfmon event select for SBo 3 counter 2.     |
| 742H             |     | MSR_S3_PMON_EVTSEL3     | Package | Uncore SBo 3 perfmon event select for SBo 3 counter 3.     |
| 743H             |     | MSR_S3_PMON_BOX_FILTER  | Package | Uncore SBo 3 perfmon box-wide filter.                      |
| 744H             |     | MSR_S3_PMON_CTR0        | Package | Uncore SBo 3 perfmon counter 0.                            |
| 745H             |     | MSR_S3_PMON_CTR1        | Package | Uncore SBo 3 perfmon counter 1.                            |
| 746H             |     | MSR_S3_PMON_CTR2        | Package | Uncore SBo 3 perfmon counter 2.                            |
| 747H             |     | MSR_S3_PMON_CTR3        | Package | Uncore SBo 3 perfmon counter 3.                            |
| E00H             |     | MSR_CO_PMON_BOX_CTL     | Package | Uncore C-box 0 perfmon for box-wide control                |
| E01H             |     | MSR_CO_PMON_EVTSEL0     | Package | Uncore C-box 0 perfmon event select for C-box 0 counter 0. |
| E02H             |     | MSR_CO_PMON_EVTSEL1     | Package | Uncore C-box 0 perfmon event select for C-box 0 counter 1. |
| E03H             |     | MSR_CO_PMON_EVTSEL2     | Package | Uncore C-box 0 perfmon event select for C-box 0 counter 2. |
| E04H             |     | MSR_CO_PMON_EVTSEL3     | Package | Uncore C-box 0 perfmon event select for C-box 0 counter 3. |
| E05H             |     | MSR_CO_PMON_BOX_FILTER0 | Package | Uncore C-box 0 perfmon box wide filter 0.                  |
| E06H             |     | MSR_CO_PMON_BOX_FILTER1 | Package | Uncore C-box 0 perfmon box wide filter 1.                  |
| E07H             |     | MSR_CO_PMON_BOX_STATUS  | Package | Uncore C-box 0 perfmon box wide status.                    |
| E08H             |     | MSR_CO_PMON_CTR0        | Package | Uncore C-box 0 perfmon counter 0.                          |
| E09H             |     | MSR_CO_PMON_CTR1        | Package | Uncore C-box 0 perfmon counter 1.                          |
| E0AH             |     | MSR_CO_PMON_CTR2        | Package | Uncore C-box 0 perfmon counter 2.                          |
| E0BH             |     | MSR_CO_PMON_CTR3        | Package | Uncore C-box 0 perfmon counter 3.                          |
| E10H             |     | MSR_C1_PMON_BOX_CTL     | Package | Uncore C-box 1 perfmon for box-wide control                |
| E11H             |     | MSR_C1_PMON_EVTSEL0     | Package | Uncore C-box 1 perfmon event select for C-box 1 counter 0. |
| E12H             |     | MSR_C1_PMON_EVTSEL1     | Package | Uncore C-box 1 perfmon event select for C-box 1 counter 1. |
| E13H             |     | MSR_C1_PMON_EVTSEL2     | Package | Uncore C-box 1 perfmon event select for C-box 1 counter 2. |
| E14H             |     | MSR_C1_PMON_EVTSEL3     | Package | Uncore C-box 1 perfmon event select for C-box 1 counter 3. |
| E15H             |     | MSR_C1_PMON_BOX_FILTER0 | Package | Uncore C-box 1 perfmon box wide filter 0.                  |

Table 2-32. Uncore PMU MSRs in Intel® Xeon® Processor E5 v3 Family (Contd.)

| Register Address |     | Register Name           | Scope   | Bit Description  |

| E16H             |     | MSR_C1_PMON_BOX_FILTER1 | Package | Uncore C-box 1 perfmon box wide filter1.                   |
| E17H             |     | MSR_C1_PMON_BOX_STATUS  | Package | Uncore C-box 1 perfmon box wide status.                    |
| E18H             |     | MSR_C1_PMON_CTR0        | Package | Uncore C-box 1 perfmon counter 0.                          |
| E19H             |     | MSR_C1_PMON_CTR1        | Package | Uncore C-box 1 perfmon counter 1.                          |
| E1AH             |     | MSR_C1_PMON_CTR2        | Package | Uncore C-box 1 perfmon counter 2.                          |
| E1BH             |     | MSR_C1_PMON_CTR3        | Package | Uncore C-box 1 perfmon counter 3.                          |
| E20H             |     | MSR_C2_PMON_BOX_CTL     | Package | Uncore C-box 2 perfmon for box-wide control                |
| E21H             |     | MSR_C2_PMON_EVNTSEL0    | Package | Uncore C-box 2 perfmon event select for C-box 2 counter 0. |
| E22H             |     | MSR_C2_PMON_EVNTSEL1    | Package | Uncore C-box 2 perfmon event select for C-box 2 counter 1. |
| E23H             |     | MSR_C2_PMON_EVNTSEL2    | Package | Uncore C-box 2 perfmon event select for C-box 2 counter 2. |
| E24H             |     | MSR_C2_PMON_EVNTSEL3    | Package | Uncore C-box 2 perfmon event select for C-box 2 counter 3. |
| E25H             |     | MSR_C2_PMON_BOX_FILTER0 | Package | Uncore C-box 2 perfmon box wide filter 0.                  |
| E26H             |     | MSR_C2_PMON_BOX_FILTER1 | Package | Uncore C-box 2 perfmon box wide filter1.                   |
| E27H             |     | MSR_C2_PMON_BOX_STATUS  | Package | Uncore C-box 2 perfmon box wide status.                    |
| E28H             |     | MSR_C2_PMON_CTR0        | Package | Uncore C-box 2 perfmon counter 0.                          |
| E29H             |     | MSR_C2_PMON_CTR1        | Package | Uncore C-box 2 perfmon counter 1.                          |
| E2AH             |     | MSR_C2_PMON_CTR2        | Package | Uncore C-box 2 perfmon counter 2.                          |
| E2BH             |     | MSR_C2_PMON_CTR3        | Package | Uncore C-box 2 perfmon counter 3.                          |
| E30H             |     | MSR_C3_PMON_BOX_CTL     | Package | Uncore C-box 3 perfmon for box-wide control                |
| E31H             |     | MSR_C3_PMON_EVNTSEL0    | Package | Uncore C-box 3 perfmon event select for C-box 3 counter 0. |
| E32H             |     | MSR_C3_PMON_EVNTSEL1    | Package | Uncore C-box 3 perfmon event select for C-box 3 counter 1. |
| E33H             |     | MSR_C3_PMON_EVNTSEL2    | Package | Uncore C-box 3 perfmon event select for C-box 3 counter 2. |
| E34H             |     | MSR_C3_PMON_EVNTSEL3    | Package | Uncore C-box 3 perfmon event select for C-box 3 counter 3. |
| E35H             |     | MSR_C3_PMON_BOX_FILTER0 | Package | Uncore C-box 3 perfmon box wide filter 0.                  |
| E36H             |     | MSR_C3_PMON_BOX_FILTER1 | Package | Uncore C-box 3 perfmon box wide filter1.                   |
| E37H             |     | MSR_C3_PMON_BOX_STATUS  | Package | Uncore C-box 3 perfmon box wide status.                    |
| E38H             |     | MSR_C3_PMON_CTR0        | Package | Uncore C-box 3 perfmon counter 0.                          |
| E39H             |     | MSR_C3_PMON_CTR1        | Package | Uncore C-box 3 perfmon counter 1.                          |
| E3AH             |     | MSR_C3_PMON_CTR2        | Package | Uncore C-box 3 perfmon counter 2.                          |
| E3BH             |     | MSR_C3_PMON_CTR3        | Package | Uncore C-box 3 perfmon counter 3.                          |
| E40H             |     | MSR_C4_PMON_BOX_CTL     | Package | Uncore C-box 4 perfmon for box-wide control                |
| E41H             |     | MSR_C4_PMON_EVNTSEL0    | Package | Uncore C-box 4 perfmon event select for C-box 4 counter 0. |
| E42H             |     | MSR_C4_PMON_EVNTSEL1    | Package | Uncore C-box 4 perfmon event select for C-box 4 counter 1. |
| E43H             |     | MSR_C4_PMON_EVNTSEL2    | Package | Uncore C-box 4 perfmon event select for C-box 4 counter 2. |
| E44H             |     | MSR_C4_PMON_EVNTSEL3    | Package | Uncore C-box 4 perfmon event select for C-box 4 counter 3. |
| E45H             |     | MSR_C4_PMON_BOX_FILTER0 | Package | Uncore C-box 4 perfmon box wide filter 0.                  |
| E46H             |     | MSR_C4_PMON_BOX_FILTER1 | Package | Uncore C-box 4 perfmon box wide filter1.                   |

Table 2-32. Uncore PMU MSRs in Intel® Xeon® Processor E5 v3 Family (Contd.)

| E54H             |     | MSR_C5_PMON_EVNTSEL3    | Package | Uncore C-box 5 perfmon event select for C-box 5 counter 3. |
| E55H             |     | MSR_C5_PMON_BOX_FILTER0 | Package | Uncore C-box 5 perfmon box wide filter 0.                  |
| E56H             |     | MSR_C5_PMON_BOX_FILTER1 | Package | Uncore C-box 5 perfmon box wide filter1.                   |
| E57H             |     | MSR_C5_PMON_BOX_STATUS  | Package | Uncore C-box 5 perfmon box wide status.                    |
| E58H             |     | MSR_C5_PMON_CTR0        | Package | Uncore C-box 5 perfmon counter 0.                          |
| E59H             |     | MSR_C5_PMON_CTR1        | Package | Uncore C-box 5 perfmon counter 1.                          |
| E5AH             |     | MSR_C5_PMON_CTR2        | Package | Uncore C-box 5 perfmon counter 2.                          |
| E5BH             |     | MSR_C5_PMON_CTR3        | Package | Uncore C-box 5 perfmon counter 3.                          |
| E60H             |     | MSR_C6_PMON_BOX_CTL     | Package | Uncore C-box 6 perfmon for box-wide control                |
| E61H             |     | MSR_C6_PMON_EVNTSEL0    | Package | Uncore C-box 6 perfmon event select for C-box 6 counter 0. |
| E62H             |     | MSR_C6_PMON_EVNTSEL1    | Package | Uncore C-box 6 perfmon event select for C-box 6 counter 1. |
| E63H             |     | MSR_C6_PMON_EVNTSEL2    | Package | Uncore C-box 6 perfmon event select for C-box 6 counter 2. |
| E64H             |     | MSR_C6_PMON_EVNTSEL3    | Package | Uncore C-box 6 perfmon event select for C-box 6 counter 3. |
| E65H             |     | MSR_C6_PMON_BOX_FILTER0 | Package | Uncore C-box 6 perfmon box wide filter 0.                  |
| E66H             |     | MSR_C6_PMON_BOX_FILTER1 | Package | Uncore C-box 6 perfmon box wide filter1.                   |
| E67H             |     | MSR_C6_PMON_BOX_STATUS  | Package | Uncore C-box 6 perfmon box wide status.                    |
| E68H             |     | MSR_C6_PMON_CTR0        | Package | Uncore C-box 6 perfmon counter 0.                          |
| E69H             |     | MSR_C6_PMON_CTR1        | Package | Uncore C-box 6 perfmon counter 1.                          |
| E6AH             |     | MSR_C6_PMON_CTR2        | Package | Uncore C-box 6 perfmon counter 2.                          |
| E6BH             |     | MSR_C6_PMON_CTR3        | Package | Uncore C-box 6 perfmon counter 3.                          |
| E70H             |     | MSR_C7_PMON_BOX_CTL     | Package | Uncore C-box 7 perfmon for box-wide control.               |
| E71H             |     | MSR_C7_PMON_EVNTSEL0    | Package | Uncore C-box 7 perfmon event select for C-box 7 counter 0. |
| E72H             |     | MSR_C7_PMON_EVNTSEL1    | Package | Uncore C-box 7 perfmon event select for C-box 7 counter 1. |
| E73H             |     | MSR_C7_PMON_EVNTSEL2    | Package | Uncore C-box 7 perfmon event select for C-box 7 counter 2. |
| E74H             |     | MSR_C7_PMON_EVNTSEL3    | Package | Uncore C-box 7 perfmon event select for C-box 7 counter 3. |
| E75H             |     | MSR_C7_PMON_BOX_FILTER0 | Package | Uncore C-box 7 perfmon box wide filter 0.                  |
| E76H             |     | MSR_C7_PMON_BOX_FILTER1 | Package | Uncore C-box 7 perfmon box wide filter1.                   |
| E77H             |     | MSR_C7_PMON_BOX_STATUS  | Package | Uncore C-box 7 perfmon box wide status.                    |

Table 2-32. Uncore PMU MSRs in Intel® Xeon® Processor E5 v3 Family (Contd.)

| Register Address |     | Register Name            | Scope   | Bit Description  |

| F10H             |     | MSR_C17_PMON_BOX_CTL     | Package | Uncore C-box 17 perfmon for box-wide control                 |
| F11H             |     | MSR_C17_PMON_EVNTSELO    | Package | Uncore C-box 17 perfmon event select for C-box 17 counter 0. |
| F12H             |     | MSR_C17_PMON_EVNTSEL1    | Package | Uncore C-box 17 perfmon event select for C-box 17 counter 1. |
| F13H             |     | MSR_C17_PMON_EVNTSEL2    | Package | Uncore C-box 17 perfmon event select for C-box 17 counter 2. |
| F14H             |     | MSR_C17_PMON_EVNTSEL3    | Package | Uncore C-box 17 perfmon event select for C-box 17 counter 3. |
| F15H             |     | MSR_C17_PMON_BOX_FILTER0 | Package | Uncore C-box 17 perfmon box wide filter 0.                   |
| F16H             |     | MSR_C17_PMON_BOX_FILTER1 | Package | Uncore C-box 17 perfmon box wide filter 1.                   |
| F17H             |     | MSR_C17_PMON_BOX_STATUS  | Package | Uncore C-box 17 perfmon box wide status.                     |
| F18H             |     | MSR_C17_PMON_CTR0        | Package | Uncore C-box 17 perfmon counter 0.                           |
| F19H             |     | MSR_C17_PMON_CTR1        | Package | Uncore C-box 17 perfmon counter 1.                           |
| F1AH             |     | MSR_C17_PMON_CTR2        | Package | Uncore C-box 17 perfmon counter 2.                           |
| F1BH             |     | MSR_C17_PMON_CTR3        | Package | Uncore C-box 17 perfmon counter 3.                           |

## 2.14 MSRS IN INTEL® CORE™ M PROCESSORS AND 5TH GENERATION INTEL CORE PROCESSORS

The Intel® Core™ M-5xxx processors and 5th generation Intel® Core™ Processors, and Intel® Xeon® Processor E3-1200 v4 family are based on the Broadwell microarchitecture. The Intel® Core™ M-5xxx processors and 5th generation Intel® Core™ Processors have CPUID DisplayFamily\_DisplayModel signature 06\_3DH. Intel® Xeon® Processor E3-1200 v4 family and the 5th generation Intel® Core™ Processors have CPUID DisplayFamily\_DisplayModel signature 06\_47H. Processors with signatures 06\_3DH and 06\_47H support the MSR interfaces listed in Table 2-19, Table 2-20, Table 2-21, Table 2-24, Table 2-28, Table 2-29, Table 2-33, and Table 2-34. For an MSR listed in Table 2-34 that also appears in the model-specific tables of prior generations, Table 2-34 supercede prior generation tables.

Table 2-33 lists MSRs that are common to processors based on the Broadwell microarchitectures (including CPUID signatures 06\_3DH, 06\_47H, 06\_4FH, and 06\_56H).

**Table 2-33. Additional MSRs Common to Processors Based the Broadwell Microarchitectures**

| Register Address |     | Register Name           | Scope  | Bit Description   |

## 2.15 MSRS IN INTEL® XEON® PROCESSORS E5 V4 FAMILY

The MSRs listed in Table 2-35 are available and common to Intel® Xeon® Processor D product Family (CPUID DisplayFamily\_DisplayModel = 06\_56H) and to Intel Xeon processors E5 v4, E7 v4 families (CPUID DisplayFamily\_DisplayModel = 06\_4FH). They are based on the Broadwell microarchitecture.

See Section 2.15.1 for lists of tables of MSRs that are supported by Intel® Xeon® Processor D Family.

### 2.15.1 Additional MSRs Supported in the Intel® Xeon® Processor D Product Family

The MSRs listed in Table 2-36 are available to Intel® Xeon® Processor D Product Family (CPUID DisplayFamily\_DisplayModel = 06\_56H). The Intel® Xeon® processor D product family is based on the Broadwell microarchitecture and supports the MSR interfaces listed in Table 2-19, Table 2-28, Table 2-33, Table 2-35, and Table 2-36.

**Table 2-36. Additional MSRs Supported by Intel® Xeon® Processor D with DisplayFamily\_DisplayModel 06\_56H**

| Register Address |     | Register Name          | Scope   | Bit Description   |

**NOTES:**

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

## 2.15.2 Additional MSRs Supported in Intel® Xeon® Processors E5 v4 and E7 v4 Families

The MSRs listed in Table 2-36 are available to Intel® Xeon® Processor E5 v4 and E7 v4 Families (CPUID DisplayFamily\_DisplayModel = 06\_4FH). The Intel® Xeon® processor E5 v4 family is based on the Broadwell

microarchitecture and supports the MSR interfaces listed in Table 2-19, Table 2-20, Table 2-28, Table 2-33, Table 2-35, and Table 2-37.

**Table 2-37. Additional MSRs Supported by Intel® Xeon® Processors with DisplayFamily\_DisplayModel 06\_4FH**

| Register Address |      | Register Name          | Scope   | Bit Description  |
|------------------|------|------------------------|---------|--|

| See Table 2-19, Table 2-20, Table 2-28, and Table 2-29 for other MSR definitions applicable to processors with CPUID signature 06_45H. |      |                  |         |   |

**NOTES:**

1. An override configuration lower than the factory-set configuration is always supported. An override configuration higher than the factory-set configuration is dependent on features specific to the processor and the platform.

## 2.16 MSRS IN THE 6TH GENERATION INTEL® CORE™ PROCESSORS, INTEL® XEON® PROCESSOR SCALABLE FAMILY, 7TH GENERATION INTEL® CORE™ PROCESSORS, AND FUTURE INTEL® CORE™ PROCESSORS

6th generation Intel® Core™ processors and the Intel® Xeon® Processor Scalable Family are based on the Skylake microarchitecture and have CPUID DisplayFamily\_DisplayModel signatures of 06\_4EH, 06\_5EH, and 06\_55H. 7th Generation Intel® Core™ processors are based on the Kaby Lake microarchitecture and have CPUID DisplayFamily\_DisplayModel signatures of 06\_8EH and 06\_9EH. Future Intel® Core™ processors are based on Cannon Lake microarchitecture and have a CPUID DisplayFamily\_DisplayModel signature of 06\_66H. These processors support the MSR interfaces listed in Table 2-19, Table 2-20, Table 2-24, Table 2-28, Table 2-34, Table 2-38, and Table 2-39. For an MSR listed in Table 2-38 that also appears in the model-specific tables of prior generations, Table 2-38 supercede prior generation tables.

The notation of “Platform” in the Scope column (with respect to MSR\_PLATFORM\_ENERGY\_COUNTER and MSR\_PLATFORM\_POWER\_LIMIT) is limited to the power-delivery domain and the specifics of the power delivery integration may vary by platform vendor’s implementation.

**Table 2-38. Additional MSRs Supported by 6th Generation Intel® Core™ Processors and the Intel® Xeon® Processor Scalable Family Based on Skylake Microarchitecture, 7th Generation Intel® Core™ Processors Based on Kaby Lake Microarchitecture, and Future Intel® Core™ Processors Based on Cannon Lake Microarchitecture**

Default value is 0 for processors that support Race to Halt optimization. Default value is 1 for processors that do not support Race to Halt optimization.   |
|                  |     | 20                      |         | <b>Disable Energy Efficiency Optimization (R/W)</b><br>Setting this bit disables the P-States energy efficiency optimization. Default value is 0. Disable/enable the energy efficiency optimization in P-State legacy mode (when IA32_PM_ENABLE[HWP_ENABLE] = 0), has an effect only in the turbo range or into PERF_MIN_CTL value if it is not zero set. In HWP mode (IA32_PM_ENABLE[HWP_ENABLE] == 1), has an effect between the OS desired or OS maximize to the OS minimize performance setting. |

## 2.16.1 MSRs Specific to 7th Generation Intel® Core™ Processors based on Kaby Lake Microarchitecture

Table 2-41 lists additional MSRs for 7th generation Intel Core processors with a CPUID DisplayFamily\_DisplayModel signature of 06\_8EH and 06\_9EH. For an MSR listed in Table 2-41 that also appears in the model-specific tables of prior generations, Table 2-41 supersedes prior generation tables.

**Table 2-40. Additional MSRs Supported by 7th Generation Intel® Core™ Processors Based on Kaby Lake Microarchitecture**

| Register Address |     | Register Name                  | Scope   | Bit Description  |
|------------------|-----|--------------------------------|---------|--|
| Hex              | Dec |                                |         |  |
| 80H              | 128 | MSR_TRACE_HUB_STH ACPIBAR_BASE | Package | NPK address used by AET messages (R/W)   |
|                  |     | 0                              |         | Lock Bit<br>If set then this MSR cannot be re-written anymore. Lock bit has to be set in order for the AET packets to be directed to NPK MMIO. |
|                  |     | 17:1                           |         | Reserved.  |

## 2.16.2 MSRs Specific to Future Intel® Core™ Processors

Table 2-41 lists additional MSRs for Future Intel Core processors with a CPUID DisplayFamily\_DisplayModel signature of 06\_66H. For an MSR listed in Table 2-41 that also appears in the model-specific tables of prior generations, Table 2-41 supersedes prior generation tables.

**Table 2-41. Additional MSRs Supported by Future Intel® Core™ Processors Based on Cannon Lake Microarchitecture**

|                  |      | 63:0                  |         | Value since last reset for the Core C1 residency. Counter rate is the Max Non-Turbo frequency (same as TSC). This counter count in case that both of the core's thread are in idle state and at least one of the core's thread residency in C1 state or in one of its sub state. The counter is updated only after core C state exit. Note: Always reads 0 if core C1 is unsupported. A value of zero indicates that this processor does not support core C1 or never entered core C1 level state. |
| 662H             | 1634 | MSR_CORE_C3_RESIDENCY | Core    | Core C3 Residency Counter (R/O)  |
|                  |      | 63:0                  |         | Will always return 0.  |

### 2.16.3 MSRs Specific to Intel® Xeon® Processor Scalable Family

Intel® Xeon® Processor Scalable Family (CUID DisplayFamily\_DisplayModel = 06\_55H) support the MSRs listed in Table 2-42.

**Table 2-42. MSRs Supported by Intel® Xeon® Processor Scalable Family with DisplayFamily\_DisplayModel 06\_55H**

| Register Address |     | Register Name        | Scope  | Bit Description   |

## 2.17 MSRS IN INTEL® XEON PHI™ PROCESSOR 3200/5200/7200 SERIES AND FUTURE INTEL® XEON PHI™ PROCESSOR

Intel® Xeon Phi™ processor 3200, 5200, 7200 series, with CPUID DisplayFamily\_DisplayModel signature 06\_57H, supports the MSR interfaces listed in Table 2-43. These processors are based on the Knights Landing microarchitecture. Future Intel® Xeon Phi™ Processor, with CPUID DisplayFamily\_DisplayModel signature 06\_85H, supports the MSR interfaces listed in Table 2-43 and Table 2-44. Some MSRs are shared between a pair of processor cores, the scope is marked as module.

**Table 2-43. Selected MSRs Supported by Intel® Xeon Phi™ Processors with DisplayFamily\_DisplayModel Signatures 06\_57H and 06\_85H**

| Address |     | Register Name   | Scope  | Bit Description                                 |
|---------|-----|-----------------|--------|---|
| Hex     | Dec |                 |        |   |
| 0H      | 0   | IA32_P5_MC_ADDR | Module | See Section 2.22, "MSRs in Pentium Processors." |
| 1H      | 1   | IA32_P5_MC_TYPE | Module | See Section 2.22, "MSRs in Pentium Processors." |

| 815H    | 2069 | IA32_X2APIC_ISR5    | Thread | x2APIC In-Service register bits [191:160] (R/O)                            |
| 816H    | 2070 | IA32_X2APIC_ISR6    | Thread | x2APIC In-Service register bits [223:192] (R/O)                            |
| 817H    | 2071 | IA32_X2APIC_ISR7    | Thread | x2APIC In-Service register bits [255:224] (R/O)                            |
| 818H    | 2072 | IA32_X2APIC_TMR0    | Thread | x2APIC Trigger Mode register bits [31:0] (R/O)                             |
| 819H    | 2073 | IA32_X2APIC_TMR1    | Thread | x2APIC Trigger Mode register bits [63:32] (R/O)                            |
| 81AH    | 2074 | IA32_X2APIC_TMR2    | Thread | x2APIC Trigger Mode register bits [95:64] (R/O)                            |
| 81BH    | 2075 | IA32_X2APIC_TMR3    | Thread | x2APIC Trigger Mode register bits [127:96] (R/O)                           |
| 81CH    | 2076 | IA32_X2APIC_TMR4    | Thread | x2APIC Trigger Mode register bits [159:128] (R/O)                          |
| 81DH    | 2077 | IA32_X2APIC_TMR5    | Thread | x2APIC Trigger Mode register bits [191:160] (R/O)                          |
| 81EH    | 2078 | IA32_X2APIC_TMR6    | Thread | x2APIC Trigger Mode register bits [223:192] (R/O)                          |
| 81FH    | 2079 | IA32_X2APIC_TMR7    | Thread | x2APIC Trigger Mode register bits [255:224] (R/O)                          |
| 820H    | 2080 | IA32_X2APIC_IRR0    | Thread | x2APIC Interrupt Request register bits [31:0] (R/O)                        |
| 821H    | 2081 | IA32_X2APIC_IRR1    | Thread | x2APIC Interrupt Request register bits [63:32] (R/O)                       |
| 822H    | 2082 | IA32_X2APIC_IRR2    | Thread | x2APIC Interrupt Request register bits [95:64] (R/O)                       |
| 823H    | 2083 | IA32_X2APIC_IRR3    | Thread | x2APIC Interrupt Request register bits [127:96] (R/O)                      |
| 824H    | 2084 | IA32_X2APIC_IRR4    | Thread | x2APIC Interrupt Request register bits [159:128] (R/O)                     |
| 825H    | 2085 | IA32_X2APIC_IRR5    | Thread | x2APIC Interrupt Request register bits [191:160] (R/O)                     |
| 826H    | 2086 | IA32_X2APIC_IRR6    | Thread | x2APIC Interrupt Request register bits [223:192] (R/O)                     |
| 827H    | 2087 | IA32_X2APIC_IRR7    | Thread | x2APIC Interrupt Request register bits [255:224] (R/O)                     |
| 828H    | 2088 | IA32_X2APIC_ESR     | Thread | x2APIC Error Status register (R/W)   |

**Table 2-43. Selected MSRs Supported by Intel® Xeon Phi™ Processors with DisplayFamily\_DisplayModel Signatures 06\_57H and 06\_85H**

| Address    |      | Register Name           | Scope  | Bit Description   |
|------------|------|-------------------------|--------|---|
| Hex        | Dec  |                         |        |   |
| 82FH       | 2095 | IA32_X2APIC_LVT_CMCI    | Thread | x2APIC LVT Corrected Machine Check Interrupt register (R/W)           |
| 830H       | 2096 | IA32_X2APIC_ICR         | Thread | x2APIC Interrupt Command register (R/W)                               |
| 832H       | 2098 | IA32_X2APIC_LVT_TIMER   | Thread | x2APIC LVT Timer Interrupt register (R/W)                             |
| 833H       | 2099 | IA32_X2APIC_LVT_THERMAL | Thread | x2APIC LVT Thermal Sensor Interrupt register (R/W)                    |
| 834H       | 2100 | IA32_X2APIC_LVT_PMI     | Thread | x2APIC LVT Performance Monitor register (R/W)                         |
| 835H       | 2101 | IA32_X2APIC_LVT_LINT0   | Thread | x2APIC LVT LINT0 register (R/W)                                       |
| 836H       | 2102 | IA32_X2APIC_LVT_LINT1   | Thread | x2APIC LVT LINT1 register (R/W)                                       |
| 837H       | 2103 | IA32_X2APIC_LVT_ERROR   | Thread | x2APIC LVT Error register (R/W)                                       |
| 838H       | 2104 | IA32_X2APIC_INIT_COUNT  | Thread | x2APIC Initial Count register (R/W)                                   |
| 839H       | 2105 | IA32_X2APIC_CUR_COUNT   | Thread | x2APIC Current Count register (R/O)                                   |
| 83EH       | 2110 | IA32_X2APIC_DIV_CONF    | Thread | x2APIC Divide Configuration register (R/W)                            |
| 83FH       | 2111 | IA32_X2APIC_SELF_IPI    | Thread | x2APIC Self IPI register (W/O)  |
| C000_0080H |      | IA32_EFER               | Thread | <b>Extended Feature Enables</b><br>See Table 2-2.                     |
| C000_0081H |      | IA32_STAR               | Thread | <b>System Call Target Address (R/W)</b><br>See Table 2-2.             |
| C000_0082H |      | IA32_LSTAR              | Thread | <b>IA-32e Mode System Call Target Address (R/W)</b><br>See Table 2-2. |
| C000_0084H |      | IA32_FMASK              | Thread | <b>System Call Flag Mask (R/W)</b><br>See Table 2-2.                  |
| C000_0100H |      | IA32_FS_BASE            | Thread | <b>Map of BASE Address of FS (R/W)</b><br>See Table 2-2.              |
| C000_0101H |      | IA32_GS_BASE            | Thread | <b>Map of BASE Address of GS (R/W)</b><br>See Table 2-2.              |
| C000_0102H |      | IA32_KERNEL_GS_BASE     | Thread | <b>Swap Target of BASE Address of GS (R/W)</b> See Table 2-2.         |
| C000_0103H |      | IA32_TSC_AUX            | Thread | <b>AUXILIARY TSC Signature. (R/W)</b> See Table 2-2                   |

Table 2-44 lists model-specific registers that are supported by future Intel® Xeon Phi™ Processors based on the Knights Mill microarchitecture.

**Table 2-44. Additional MSRs Supported by Future Intel® Xeon Phi™ Processors with DisplayFamily\_DisplayModel Signature 06\_85H**

| Register Address |      | Register Name               | Scope | Bit Description   |
|------------------|------|-----------------------------|-------|---|
| Hex              | Dec  |                             |       |   |
| 9BH              | 155  | IA32_SMM_MONITOR_CTL        | Core  | SMM Monitor Configuration (R/W).<br>This MSR is readable only if VMX is enabled, and writeable only if VMX is enabled and in SMM mode, and is used to configure the VMX MSEG base address. See Table 2-2. |
| 480H             | 1152 | IA32_VMX_BASIC              | Core  | Reporting Register of Basic VMX Capabilities (R/O)<br>See Table 2-2.  |
| 481H             | 1153 | IA32_VMX_PINBASED_CTL       | Core  | Capability Reporting Register of Pin-based VM-execution Controls (R/O)<br>See Table 2-2.  |
| 482H             | 1154 | IA32_VMX_PROCBASED_CTL      | Core  | Capability Reporting Register of Primary Processor-based VM-execution Controls (R/O)  |
| 483H             | 1155 | IA32_VMX_EXIT_CTL           | Core  | Capability Reporting Register of VM-exit Controls (R/O)<br>See Table 2-2.   |
| 484H             | 1156 | IA32_VMX_ENTRY_CTL          | Core  | Capability Reporting Register of VM-entry Controls (R/O)<br>See Table 2-2.  |
| 485H             | 1157 | IA32_VMX_MISC               | Core  | Reporting Register of Miscellaneous VMX Capabilities (R/O)<br>See Table 2-2.  |
| 486H             | 1158 | IA32_VMX_CR0_FIXED0         | Core  | Capability Reporting Register of CR0 Bits Fixed to 0 (R/O)<br>See Table 2-2.  |
| 487H             | 1159 | IA32_VMX_CR0_FIXED1         | Core  | Capability Reporting Register of CR0 Bits Fixed to 1 (R/O)<br>See Table 2-2.  |
| 488H             | 1160 | IA32_VMX_CR4_FIXED0         | Core  | Capability Reporting Register of CR4 Bits Fixed to 0 (R/O)<br>See Table 2-2.  |
| 489H             | 1161 | IA32_VMX_CR4_FIXED1         | Core  | Capability Reporting Register of CR4 Bits Fixed to 1 (R/O)<br>See Table 2-2.  |
| 48AH             | 1162 | IA32_VMX_VMCS_ENUM          | Core  | Capability Reporting Register of VMCS Field Enumeration (R/O)<br>See Table 2-2.   |
| 48BH             | 1163 | IA32_VMX_PROCBASED_CTL2     | Core  | Capability Reporting Register of Secondary Processor-based VM-execution Controls (R/O)<br>See Table 2-2.  |
| 48CH             | 1164 | IA32_VMX_EPT_VPID_ENUM      | Core  | Capability Reporting Register of EPT and VPID (R/O)<br>See Table 2-2.   |
| 48DH             | 1165 | IA32_VMX_TRUE_PINBASED_CTL  | Core  | Capability Reporting Register of Pin-based VM-execution Flex Controls (R/O)<br>See Table 2-2.   |
| 48EH             | 1166 | IA32_VMX_TRUE_PROCBASED_CTL | Core  | Capability Reporting Register of Primary Processor-based VM-execution Flex Controls (R/O)<br>See Table 2-2.   |
| 48FH             | 1167 | IA32_VMX_TRUE_EXIT_CTL      | Core  | Capability Reporting Register of VM-exit Flex Controls (R/O)<br>See Table 2-2.  |

**Table 2-44. Additional MSRs Supported by Future Intel® Xeon Phi™ Processors with DisplayFamily\_DisplayModel Signature 06\_85H**

| Register Address |      | Register Name             | Scope | Bit Description   |
|------------------|------|---------------------------|-------|---|
| Hex              | Dec  |                           |       |   |
| 490H             | 1168 | IA32_VMX_TRUE_ENTRY_C TLS | Core  | Capability Reporting Register of VM-entry Flex Controls (R/O)<br>See Table 2-2. |
| 491H             | 1169 | IA32_VMX_FMFUNC           | Core  | Capability Reporting Register of VM-function Controls (R/O)<br>See Table 2-2.   |

## 2.18 MSRS IN THE PENTIUM® 4 AND INTEL® XEON® PROCESSORS

Table 2-45 lists MSRs (architectural and model-specific) that are defined across processor generations based on Intel NetBurst microarchitecture. The processor can be identified by its CPUID signatures of DisplayFamily encoding of 0FH, see Table 2-1.

- MSRs with an “IA32\_” prefix are designated as “architectural.” This means that the functions of these MSRs and their addresses remain the same for succeeding families of IA-32 processors.
- MSRs with an “MSR\_” prefix are model specific with respect to address functionalities. The column “Model Availability” lists the model encoding value(s) within the Pentium 4 and Intel Xeon processor family at the specified register address. The model encoding value of a processor can be queried using CPUID. See “CPUID—CPU Identification” in Chapter 3 of the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2A*.

**Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors**

| Register Address |     | Register Name<br>Fields and Flags | Model<br>Avail-<br>ability | Shared/<br>Unique <sup>1</sup> | Bit Description   |
|------------------|-----|-----------------------------------|----------------------------|--------------------------------|---|
| Hex              | Dec |                                   |                            |                                |   |
| 0H               | 0   | IA32_P5_MC_ADDR                   | 0, 1, 2, 3,<br>4, 6        | Shared                         | See Section 2.22, “MSRs in Pentium Processors.”   |
| 1H               | 1   | IA32_P5_MC_TYPE                   | 0, 1, 2, 3,<br>4, 6        | Shared                         | See Section 2.22, “MSRs in Pentium Processors.”   |
| 6H               | 6   | IA32_MONITOR_FILTER_LINE_ SIZE    | 3, 4, 6                    | Shared                         | See Section 8.10.5, “Monitor/Mwait Address Range Determination.”  |
| 10H              | 16  | IA32_TIME_STAMP_COUNTER           | 0, 1, 2, 3,<br>4, 6        | Unique                         | <b>Time Stamp Counter</b><br>See Table 2-2.   |
|                  |     |                                   |                            |                                | On earlier processors, only the lower 32 bits are writable. On any write to the lower 32 bits, the upper 32 bits are cleared. For processor family 0FH, models 3 and 4: all 64 bits are writable. |
| 17H              | 23  | IA32_PLATFORM_ID                  | 0, 1, 2, 3,<br>4, 6        | Shared                         | <b>Platform ID (R)</b><br>See Table 2-2.<br><br>The operating system can use this MSR to determine “slot” information for the processor and the proper microcode update to load.                  |
| 1BH              | 27  | IA32_APIC_BASE                    | 0, 1, 2, 3,<br>4, 6        | Unique                         | <b>APIC Location and Status (R/W)</b><br>See Table 2-2. See Section 10.4.4, “Local APIC Status and Location.”   |

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

| Register Address |     | Register Name<br>Fields and Flags | Model<br>Avail-<br>ability | Shared/<br>Unique <sup>1</sup> | Bit Description   |
|------------------|-----|-----------------------------------|----------------------------|--------------------------------|---|
| Hex              | Dec |                                   |                            |                                |   |

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

| Register Address |     | Register Name Fields and Flags | Model Availability | Shared/Unique <sup>1</sup> | Bit Description  |
|------------------|-----|--------------------------------|--------------------|----------------------------|--|
| Hex              | Dec |                                |                    |                            |  |
|                  |     | 6                              |                    |                            | <b>Third-Level Cache Disable (R/W)</b><br>When set, the third-level cache is disabled; when clear (default) the third-level cache is enabled. This flag is reserved for processors that do not have a third-level cache.<br><br>Note that the bit controls only the third-level cache; and only if overall caching is enabled through the CD flag of control register CRO, the page-level cache controls, and/or the MTRRs. See Section 11.5.4, "Disabling and Enabling the L3 Cache." |
|                  |     | 7                              |                    |                            | <b>Performance Monitoring Available (R)</b><br>See Table 2-2.  |
|                  |     | 8                              |                    |                            | <b>Suppress Lock Enable</b><br>When set, assertion of LOCK on the bus is suppressed during a Split Lock access. When clear (default), LOCK is not suppressed.  |
|                  |     | 9                              |                    |                            | <b>Prefetch Queue Disable</b><br>When set, disables the prefetch queue. When clear (default), enables the prefetch queue.  |
|                  |     | 10                             |                    |                            | <b>FERR# Interrupt Reporting Enable (R/W)</b><br>When set, interrupt reporting through the FERR# pin is enabled; when clear, this interrupt reporting function is disabled.  |
|                  |     |                                |                    |                            | When this flag is set and the processor is in the stop-clock state (STPCLK# is asserted), asserting the FERR# pin signals to the processor that an interrupt (such as, INIT#, BINIT#, INTR, NMI, SMI#, or RESET#) is pending and that the processor should return to normal operation to handle the interrupt.   |
|                  |     |                                |                    |                            | This flag does not affect the normal operation of the FERR# pin (to indicate an unmasked floating-point error) when the STPCLK# pin is not asserted.   |
|                  |     | 11                             |                    |                            | <b>Branch Trace Storage Unavailable (BTS_UNAVAILABLE) (R)</b><br>See Table 2-2.<br>When set, the processor does not support branch trace storage (BTS); when clear, BTS is supported.  |
|                  |     | 12                             |                    |                            | <b>PEBS_UNAVAILABLE: Processor Event Based Sampling Unavailable (R)</b><br>See Table 2-2.<br>When set, the processor does not support processor event-based sampling (PEBS); when clear, PEBS is supported.  |

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

| Register Address |     | Register Name Fields and Flags | Model Availability | Shared/Unique <sup>1</sup> | Bit Description  |
|------------------|-----|--------------------------------|--------------------|----------------------------|--|
| Hex              | Dec |                                |                    |                            |  |
|                  |     | 13                             | 3                  |                            | <b>TM2 Enable (R/W)</b><br>When this bit is set (1) and the thermal sensor indicates that the die temperature is at the pre-determined threshold, the Thermal Monitor 2 mechanism is engaged. TM2 will reduce the bus to core ratio and voltage according to the value last written to MSR_THERM2_CTL bits 15:0.<br><br>When this bit is clear (0, default), the processor does not change the VID signals or the bus to core ratio when the processor enters a thermal managed state.<br><br>If the TM2 feature flag (ECX[8]) is not set to 1 after executing CPUID with EAX = 1, then this feature is not supported and BIOS must not alter the contents of this bit location. The processor is operating out of spec if both this bit and the TM1 bit are set to disabled states. |
|                  |     | 17:14                          |                    |                            | Reserved.  |
|                  |     | 18                             | 3, 4, 6            |                            | <b>ENABLE MONITOR FSM (R/W)</b><br>See Table 2-2.  |
|                  |     | 19                             |                    |                            | <b>Adjacent Cache Line Prefetch Disable (R/W)</b><br>When set to 1, the processor fetches the cache line of the 128-byte sector containing currently required data. When set to 0, the processor fetches both cache lines in the sector.   |
|                  |     |                                |                    |                            | Single processor platforms should not set this bit. Server platforms should set or clear this bit based on platform performance observed in validation and testing.<br><br>BIOS may contain a setup option that controls the setting of this bit.  |
|                  |     | 21:20                          |                    |                            | Reserved.  |
|                  |     | 22                             | 3, 4, 6            |                            | <b>Limit CPUID MAXVAL (R/W)</b><br>See Table 2-2.<br><br>Setting this can cause unexpected behavior to software that depends on the availability of CPUID leaves greater than 3.   |
|                  |     | 23                             |                    | Shared                     | <b>xTPR Message Disable (R/W)</b><br>See Table 2-2.  |

Table 2-45. MSRs in the Pentium® 4 and Intel® Xeon® Processors (Contd.)

| Register Address |     | Register Name<br>Fields and Flags | Model<br>Avail-<br>ability | Shared/<br>Unique <sup>7</sup> | Bit Description  |
|------------------|-----|-----------------------------------|----------------------------|--------------------------------|--|
| Hex              | Dec |                                   |                            |                                |  |
|                  |     | 24                                |                            |                                | <b>L1 Data Cache Context Mode (R/W)</b><br>When set, the L1 data cache is placed in shared mode; when clear (default), the cache is placed in adaptive mode. This bit is only enabled for IA-32 processors that support Intel Hyper-Threading Technology. See Section 11.5.6, "L1 Data Cache Context Mode."<br>When L1 is running in adaptive mode and CR3s are identical, data in L1 is shared across logical processors. Otherwise, L1 is not shared and cache use is competitive.<br>If the Context ID feature flag (ECX[10]) is set to 0 after executing CPUID with EAX = 1, the ability to switch modes is not supported. BIOS must not alter the contents of IA32_MISC_ENABLE[24]. |
|                  |     | 33:25                             |                            |                                | Reserved.  |

**NOTES**

1. For HT-enabled processors, there may be more than one logical processors per physical unit. If an MSR is Shared, this means that one MSR is shared between logical processors. If an MSR is unique, this means that each logical processor has its own MSR.

## 2.18.1 MSRs Unique to Intel® Xeon® Processor MP with L3 Cache

The MSRs listed in Table 2-46 apply to Intel® Xeon® Processor MP with up to 8MB level three cache. These processors can be detected by enumerating the deterministic cache parameter leaf of CPUID instruction (with EAX = 4 as input) to detect the presence of the third level cache, and with CPUID reporting family encoding 0FH, model encoding 3 or 4 (see CPUID instruction for more details).

**Table 2-46. MSRs Unique to 64-bit Intel® Xeon® Processor MP with Up to an 8 MB L3 Cache**

| Register Address |  | Register Name<br>Fields and Flags | Model Avail-<br>ability | Shared/<br>Unique | Bit Description  |
|------------------|--|-----------------------------------|-------------------------|-------------------|--|
| 107CCH           |  | MSR_IFSB_BUSQ0                    | 3, 4                    | Shared            | <b>IFSB BUSQ Event Control and Counter Register (R/W)</b><br>See Section 18.6.6, “Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache.” |
| 107CDH           |  | MSR_IFSB_BUSQ1                    | 3, 4                    | Shared            | <b>IFSB BUSQ Event Control and Counter Register (R/W)</b>  |
| 107CEH           |  | MSR_IFSB_SNPQ0                    | 3, 4                    | Shared            | <b>IFSB SNPQ Event Control and Counter Register (R/W)</b><br>See Section 18.6.6, “Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache.” |
| 107CFH           |  | MSR_IFSB_SNPQ1                    | 3, 4                    | Shared            | <b>IFSB SNPQ Event Control and Counter Register (R/W)</b>  |
| 107D0H           |  | MSR_EFSB_DRDY0                    | 3, 4                    | Shared            | <b>EFSB DRDY Event Control and Counter Register (R/W)</b><br>See Section 18.6.6, “Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache.” |
| 107D1H           |  | MSR_EFSB_DRDY1                    | 3, 4                    | Shared            | <b>EFSB DRDY Event Control and Counter Register (R/W)</b>  |
| 107D2H           |  | MSR_IFSB_CTL6                     | 3, 4                    | Shared            | <b>IFSB Latency Event Control Register (R/W)</b><br>See Section 18.6.6, “Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache.”          |
| 107D3H           |  | MSR_IFSB_CNTR7                    | 3, 4                    | Shared            | <b>IFSB Latency Event Counter Register (R/W)</b><br>See Section 18.6.6, “Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache.”          |

The MSRs listed in Table 2-47 apply to Intel® Xeon® Processor 7100 series. These processors can be detected by enumerating the deterministic cache parameter leaf of CPUID instruction (with EAX = 4 as input) to detect the presence of the third level cache, and with CPUID reporting family encoding 0FH, model encoding 6 (See CPUID instruction for more details.). The performance monitoring MSRs listed in Table 2-47 are shared between logical processors in the same core, but are replicated for each core.

**Table 2-47. MSRs Unique to Intel® Xeon® Processor 7100 Series**

| Register Address |  | Register Name<br>Fields and Flags | Model Avail-<br>ability | Shared/<br>Unique | Bit Description   |
|------------------|--|-----------------------------------|-------------------------|-------------------|---|
| 107CCH           |  | MSR_EMON_L3_CTR_CTL0              | 6                       | Shared            | <b>GBUSQ Event Control and Counter Register (R/W)</b><br>See Section 18.6.6, “Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache.”  |
| 107CDH           |  | MSR_EMON_L3_CTR_CTL1              | 6                       | Shared            | <b>GBUSQ Event Control and Counter Register (R/W)</b>   |
| 107CEH           |  | MSR_EMON_L3_CTR_CTL2              | 6                       | Shared            | <b>GSPNPQ Event Control and Counter Register (R/W)</b><br>See Section 18.6.6, “Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache.” |
| 107CFH           |  | MSR_EMON_L3_CTR_CTL3              | 6                       | Shared            | <b>GSPNPQ Event Control and Counter Register (R/W)</b>  |
| 107D0H           |  | MSR_EMON_L3_CTR_CTL4              | 6                       | Shared            | <b>FSB Event Control and Counter Register (R/W)</b><br>See Section 18.6.6, “Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache.”    |

| 107D3H           |  | MSR_EMON_L3_CTR_CTL7              | 6                       | Shared            | <b>FSB Event Control and Counter Register (R/W)</b>   |

## 2.19 MSRS IN INTEL® CORE™ SOLO AND INTEL® CORE™ DUO PROCESSORS

Model-specific registers (MSRs) for Intel Core Solo, Intel Core Duo processors, and Dual-core Intel Xeon processor LV are listed in Table 2-48. The column “Shared/Unique” applies to Intel Core Duo processor. “Unique” means each processor core has a separate MSR, or a bit field in an MSR governs only a core independently. “Shared” means the MSR or the bit field in an MSR address governs the operation of both processor cores.

**Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV**

| Register Address |     | Register Name            | Shared/<br>Unique | Bit Description   |
|------------------|-----|--------------------------|-------------------|---|
| Hex              | Dec |                          |                   |   |
| 0H               | 0   | P5_MC_ADDR               | Unique            | See Section 2.22, “MSRs in Pentium Processors,” and see Table 2-2.                  |
| 1H               | 1   | P5_MC_TYPE               | Unique            | See Section 2.22, “MSRs in Pentium Processors,” and see Table 2-2.                  |
| 6H               | 6   | IA32_MONITOR_FILTER_SIZE | Unique            | See Section 8.10.5, “Monitor/Mwait Address Range Determination,” and see Table 2-2. |
| 10H              | 16  | IA32_TIME_STAMP_COUNTER  | Unique            | See Section 17.17, “Time-Stamp Counter,” and see Table 2-2.                         |

**Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)**

| Register Address |     | Register Name      | Shared/<br>Unique | Bit Description  |
|------------------|-----|--------------------|-------------------|--|
| Hex              | Dec |                    |                   |  |
| 17H              | 23  | IA32_PLATFORM_ID   | Shared            | <b>Platform ID (R)</b><br>See Table 2-2.<br>The operating system can use this MSR to determine “slot” information for the processor and the proper microcode update to load. |
| 1BH              | 27  | IA32_APIC_BASE     | Unique            | See Section 10.4.4, “Local APIC Status and Location,” and see Table 2-2.   |
| 2AH              | 42  | MSR_EBL_CR_POWERON | Shared            | <b>Processor Hard Power-On Configuration (R/W)</b><br>Enables and disables processor features; (R) indicates current processor configuration.                                |
|                  |     | 0                  |                   | Reserved.  |
|                  |     | 1                  |                   | <b>Data Error Checking Enable (R/W)</b><br>1 = Enabled; 0 = Disabled<br>Note: Not all processor implements R/W.  |
|                  |     | 2                  |                   | <b>Response Error Checking Enable (R/W)</b><br>1 = Enabled; 0 = Disabled<br>Note: Not all processor implements R/W.  |
|                  |     | 3                  |                   | <b>MCERR# Drive Enable (R/W)</b><br>1 = Enabled; 0 = Disabled<br>Note: Not all processor implements R/W.   |
|                  |     | 4                  |                   | <b>Address Parity Enable (R/W)</b><br>1 = Enabled; 0 = Disabled<br>Note: Not all processor implements R/W.   |
|                  |     | 6: 5               |                   | Reserved   |
|                  |     | 7                  |                   | <b>BINIT# Driver Enable (R/W)</b><br>1 = Enabled; 0 = Disabled<br>Note: Not all processor implements R/W.  |
|                  |     | 8                  |                   | <b>Output Tri-state Enabled (R/O)</b><br>1 = Enabled; 0 = Disabled   |
|                  |     | 9                  |                   | <b>Execute BIST (R/O)</b><br>1 = Enabled; 0 = Disabled   |
|                  |     | 10                 |                   | <b>MCERR# Observation Enabled (R/O)</b><br>1 = Enabled; 0 = Disabled   |
|                  |     | 11                 |                   | Reserved   |
|                  |     | 12                 |                   | <b>BINIT# Observation Enabled (R/O)</b><br>1 = Enabled; 0 = Disabled   |
|                  |     | 13                 |                   | Reserved   |
|                  |     | 14                 |                   | <b>1 MByte Power on Reset Vector (R/O)</b><br>1 = 1 MByte; 0 = 4 GBytes  |
|                  |     | 15                 |                   | Reserved   |

| 400H             | 1024 | IA32_MCO_CTL       | Unique            | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."   |
| 401H             | 1025 | IA32_MCO_STATUS    | Unique            | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."  |
| 402H             | 1026 | IA32_MCO_ADDR      | Unique            | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."<br>The IA32_MCO_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MCO_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 404H             | 1028 | IA32_MC1_CTL       | Unique            | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."   |
| 405H             | 1029 | IA32_MC1_STATUS    | Unique            | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."  |
| 406H             | 1030 | IA32_MC1_ADDR      | Unique            | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."<br>The IA32_MC1_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC1_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 408H             | 1032 | IA32_MC2_CTL       | Unique            | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."   |
| 409H             | 1033 | IA32_MC2_STATUS    | Unique            | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."  |
| 40AH             | 1034 | IA32_MC2_ADDR      | Unique            | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."<br>The IA32_MC2_ADDR register is either not implemented or contains no address if the ADDR_V flag in the IA32_MC2_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception. |
| 40CH             | 1036 | MSR_MC4_CTL        | Unique            | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."   |
| 40DH             | 1037 | MSR_MC4_STATUS     | Unique            | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."  |
| 40EH             | 1038 | MSR_MC4_ADDR       | Unique            | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."<br>The MSR_MC4_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC4_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.   |
| 410H             | 1040 | IA32_MC3_CTL       |                   | See Section 15.3.2.1, "IA32_MCi_CTL MSRs."   |
| 411H             | 1041 | IA32_MC3_STATUS    |                   | See Section 15.3.2.2, "IA32_MCi_STATUS MSRs."  |
| 412H             | 1042 | MSR_MC3_ADDR       | Unique            | See Section 15.3.2.3, "IA32_MCi_ADDR MSRs."<br>The MSR_MC3_ADDR register is either not implemented or contains no address if the ADDR_V flag in the MSR_MC3_STATUS register is clear. When not implemented in the processor, all reads and writes to this MSR will cause a general-protection exception.   |
| 413H             | 1043 | MSR_MC3_MISC       | Unique            | Machine Check Error Reporting Register - contains additional information describing the machine-check error if the MISC_V flag in the IA32_MCi_STATUS register is set.   |
| 414H             | 1044 | MSR_MC5_CTL        | Unique            | Machine Check Error Reporting Register - controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).   |

**Table 2-48. MSRs in Intel® Core™ Solo, Intel® Core™ Duo Processors, and Dual-Core Intel® Xeon® Processor LV (Contd.)**

| Register Address |      | Register Name          | Shared/<br>Unique | Bit Description  |
|------------------|------|------------------------|-------------------|--|
| Hex              | Dec  |                        |                   |  |
| 415H             | 1045 | MSR_MC5_STATUS         | Unique            | Machine Check Error Reporting Register - contains information related to a machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCI_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception. |
| 416H             | 1046 | MSR_MC5_ADDR           | Unique            | Machine Check Error Reporting Register - contains the address of the code or data memory location that produced the machine-check error if the ADDR_V flag in the IA32_MCI_STATUS register is set.   |
| 417H             | 1047 | MSR_MC5_MISC           | Unique            | Machine Check Error Reporting Register - contains additional information describing the machine-check error if the MISCV flag in the IA32_MCI_STATUS register is set.  |
| 480H             | 1152 | IA32_VMX_BASIC         | Unique            | <b>Reporting Register of Basic VMX Capabilities (R/O)</b><br>See Table 2-2.<br>See Appendix A.1, “Basic VMX Information”<br>(If CPUID.01H:ECX.[bit 9])   |
| 481H             | 1153 | IA32_VMX_PINBASED_CTL  | Unique            | <b>Capability Reporting Register of Pin-based VM-execution Controls (R/O)</b><br>See Appendix A.3, “VM-Execution Controls”<br>(If CPUID.01H:ECX.[bit 9])   |
| 482H             | 1154 | IA32_VMX_PROCBASED_CTL | Unique            | <b>Capability Reporting Register of Primary Processor-based VM-execution Controls (R/O)</b><br>See Appendix A.3, “VM-Execution Controls”<br>(If CPUID.01H:ECX.[bit 9])   |
| 483H             | 1155 | IA32_VMX_EXIT_CTL      | Unique            | <b>Capability Reporting Register of VM-exit Controls (R/O)</b><br>See Appendix A.4, “VM-Exit Controls”<br>(If CPUID.01H:ECX.[bit 9])   |
| 484H             | 1156 | IA32_VMX_ENTRY_CTL     | Unique            | <b>Capability Reporting Register of VM-entry Controls (R/O)</b><br>See Appendix A.5, “VM-Entry Controls”<br>(If CPUID.01H:ECX.[bit 9])   |
| 485H             | 1157 | IA32_VMX_MISC          | Unique            | <b>Reporting Register of Miscellaneous VMX Capabilities (R/O)</b><br>See Appendix A.6, “Miscellaneous Data”<br>(If CPUID.01H:ECX.[bit 9])  |
| 486H             | 1158 | IA32_VMX_CR0_FIXED0    | Unique            | <b>Capability Reporting Register of CR0 Bits Fixed to 0 (R/O)</b><br>See Appendix A.7, “VMX-Fixed Bits in CR0”<br>(If CPUID.01H:ECX.[bit 9])   |
| 487H             | 1159 | IA32_VMX_CR0_FIXED1    | Unique            | <b>Capability Reporting Register of CR0 Bits Fixed to 1 (R/O)</b><br>See Appendix A.7, “VMX-Fixed Bits in CR0”<br>(If CPUID.01H:ECX.[bit 9])   |
| 488H             | 1160 | IA32_VMX_CR4_FIXED0    | Unique            | <b>Capability Reporting Register of CR4 Bits Fixed to 0 (R/O)</b><br>See Appendix A.8, “VMX-Fixed Bits in CR4”<br>(If CPUID.01H:ECX.[bit 9])   |

## 2.20 MSRS IN THE PENTIUM M PROCESSOR

Model-specific registers (MSRs) for the Pentium M processor are similar to those described in Section 2.21 for P6 family processors. The following table describes new MSRs and MSRs whose behavior has changed on the Pentium M processor.

**Table 2-49. MSRs in Pentium M Processors**

| Register Address |     | Register Name           | Bit Description  |
|------------------|-----|-------------------------|--|
| Hex              | Dec |                         |  |
| 0H               | 0   | P5_MC_ADDR              | See Section 2.22, “MSRs in Pentium Processors.”  |
| 1H               | 1   | P5_MC_TYPE              | See Section 2.22, “MSRs in Pentium Processors.”  |
| 10H              | 16  | IA32_TIME_STAMP_COUNTER | See Section 17.17, “Time-Stamp Counter,” and see Table 2-2.  |
| 17H              | 23  | IA32_PLATFORM_ID        | <b>Platform ID (R)</b><br>See Table 2-2.<br>The operating system can use this MSR to determine “slot” information for the processor and the proper microcode update to load. |

Table 2-49. MSRs in Pentium M Processors (Contd.)

| Register Address |     | Register Name      | Bit Description  |
|------------------|-----|--------------------|--|
| Hex              | Dec |                    |  |
| 2AH              | 42  | MSR_EBL_CR_POWERON | <b>Processor Hard Power-On Configuration (R/W)</b> Enables and disables processor features.<br><b>(R)</b> Indicates current processor configuration. |
|                  |     | 0                  | Reserved.  |
|                  |     | 1                  | <b>Data Error Checking Enable (R)</b><br>0 = Disabled<br>Always 0 on the Pentium M processor.  |
|                  |     | 2                  | <b>Response Error Checking Enable (R)</b><br>0 = Disabled<br>Always 0 on the Pentium M processor.  |
|                  |     | 3                  | <b>MCERR# Drive Enable (R)</b><br>0 = Disabled<br>Always 0 on the Pentium M processor.   |
|                  |     | 4                  | <b>Address Parity Enable (R)</b><br>0 = Disabled<br>Always 0 on the Pentium M processor.   |
|                  |     | 6:5                | Reserved.  |
|                  |     | 7                  | <b>BINIT# Driver Enable (R)</b><br>1 = Enabled; 0 = Disabled<br>Always 0 on the Pentium M processor.   |
|                  |     | 8                  | <b>Output Tri-state Enabled (R/O)</b><br>1 = Enabled; 0 = Disabled   |
|                  |     | 9                  | <b>Execute BIST (R/O)</b><br>1 = Enabled; 0 = Disabled   |
|                  |     | 10                 | <b>MCERR# Observation Enabled (R/O)</b><br>1 = Enabled; 0 = Disabled<br>Always 0 on the Pentium M processor.   |
|                  |     | 11                 | Reserved.  |
|                  |     | 12                 | <b>BINIT# Observation Enabled (R/O)</b><br>1 = Enabled; 0 = Disabled<br>Always 0 on the Pentium M processor.   |
|                  |     | 13                 | Reserved.  |
|                  |     | 14                 | <b>1 MByte Power on Reset Vector (R/O)</b><br>1 = 1 MByte; 0 = 4 GBytes<br>Always 0 on the Pentium M processor.                                      |
|                  |     | 15                 | Reserved.  |
|                  |     | 17:16              | <b>APIC Cluster ID (R/O)</b><br>Always 00B on the Pentium M processor.   |

Table 2-49. MSRs in Pentium M Processors (Contd.)

| Register Address |     | Register Name    | Bit Description  |
|------------------|-----|------------------|--|
| Hex              | Dec |                  |  |
|                  |     | 18               | <b>System Bus Frequency (R/O)</b><br>0 = 100 MHz<br>1 = Reserved<br>Always 0 on the Pentium M processor.   |
|                  |     | 19               | Reserved.  |
|                  |     | 21:20            | <b>Symmetric Arbitration ID (R/O)</b><br>Always 00B on the Pentium M processor.  |
|                  |     | 26:22            | Clock Frequency Ratio (R/O)  |
| 40H              | 64  | MSR_LASTBRANCH_0 | <b>Last Branch Record 0 (R/W)</b><br>One of 8 last branch record registers on the last branch record stack: bits 31-0 hold the 'from' address and bits 63-32 hold the to address.<br>See also: <ul style="list-style-type: none"> <li>Last Branch Record Stack TOS at 1C9H</li> <li>Section 17.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)"</li> </ul> |
| 41H              | 65  | MSR_LASTBRANCH_1 | <b>Last Branch Record 1 (R/W)</b><br>See description of MSR_LASTBRANCH_0.  |
| 42H              | 66  | MSR_LASTBRANCH_2 | <b>Last Branch Record 2 (R/W)</b><br>See description of MSR_LASTBRANCH_0.  |
| 43H              | 67  | MSR_LASTBRANCH_3 | <b>Last Branch Record 3 (R/W)</b><br>See description of MSR_LASTBRANCH_0.  |
| 44H              | 68  | MSR_LASTBRANCH_4 | <b>Last Branch Record 4 (R/W)</b><br>See description of MSR_LASTBRANCH_0.  |
| 45H              | 69  | MSR_LASTBRANCH_5 | <b>Last Branch Record 5 (R/W)</b><br>See description of MSR_LASTBRANCH_0.  |
| 46H              | 70  | MSR_LASTBRANCH_6 | <b>Last Branch Record 6 (R/W)</b><br>See description of MSR_LASTBRANCH_0.  |
| 47H              | 71  | MSR_LASTBRANCH_7 | <b>Last Branch Record 7 (R/W)</b><br>See description of MSR_LASTBRANCH_0.  |
| 119H             | 281 | MSR_BBL_CR_CTL   | Control register<br>Used to program L2 commands to be issued via cache configuration accesses mechanism. Also receives L2 lookup response.   |
|                  |     | 63:0             | Reserved.  |
| 11EH             | 281 | MSR_BBL_CR_CTL3  | Control register 3<br>Used to configure the L2 Cache.  |
|                  |     | 0                | <b>L2 Hardware Enabled (R/O)</b><br>1 = If the L2 is hardware-enabled<br>0 = Indicates if the L2 is hardware-disabled  |
|                  |     | 4:1              | Reserved.  |

Table 2-49. MSRs in Pentium M Processors (Contd.)

| Register Address |     | Register Name   | Bit Description  |
|------------------|-----|-----------------|--|
| Hex              | Dec |                 |  |
|                  |     | 5               | <b>ECC Check Enable (RO)</b><br>This bit enables ECC checking on the cache data bus. ECC is always generated on write cycles.<br>0 = Disabled (default)<br>1 = Enabled<br>For the Pentium M processor, ECC checking on the cache data bus is always enabled.                   |
|                  |     | 7:6             | Reserved.  |
|                  |     | 8               | <b>L2 Enabled (R/W)</b><br>1 = L2 cache has been initialized<br>0 = Disabled (default)<br>Until this bit is set the processor will not respond to the WBINVD instruction or the assertion of the FLUSH# input.   |
|                  |     | 22:9            | Reserved.  |
|                  |     | 23              | <b>L2 Not Present (RO)</b><br>0 = L2 Present<br>1 = L2 Not Present   |
|                  |     | 63:24           | Reserved.  |
| 179H             | 377 | IA32_MCG_CAP    | Read-only register that provides information about the machine-check architecture of the processor.  |
|                  |     | 7:0             | <b>Count (RO)</b><br>Indicates the number of hardware unit error reporting banks available in the processor.   |
|                  |     | 8               | <b>IA32_MCG_CTL Present (RO)</b><br>1 = Indicates that the processor implements the MSR_MCG_CTL register found at MSR 17BH.<br>0 = Not supported.  |
|                  |     | 63:9            | Reserved.  |
| 17AH             | 378 | IA32_MCG_STATUS | Global Machine Check Status  |
|                  |     | 0               | <b>RIPV</b><br>When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) can be used to restart the program. If this bit is cleared, the program cannot be reliably restarted.         |
|                  |     | 1               | <b>EIPV</b><br>When set, this bit indicates that the instruction addressed by the instruction pointer pushed on the stack (when the machine check was generated) is directly associated with the error.  |
|                  |     | 2               | <b>MCIP</b><br>When set, this bit indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor enters a shutdown state. Software should write this bit to 0 after processing a machine check exception. |

Table 2-49. MSRs in Pentium M Processors (Contd.)

| Register Address |     | Register Name         | Bit Description   |
|------------------|-----|-----------------------|---|
| Hex              | Dec |                       |   |
|                  |     | 63:3                  | Reserved.   |
| 198H             | 408 | IA32_PERF_STATUS      | See Table 2-2.  |
| 199H             | 409 | IA32_PERF_CTL         | See Table 2-2.  |
| 19AH             | 410 | IA32_CLOCK_MODULATION | <b>Clock Modulation (R/W).</b><br>See Table 2-2.<br>See Section 14.7.3, "Software Controlled Clock Modulation."   |
| 19BH             | 411 | IA32_THERM_INTERRUPT  | <b>Thermal Interrupt Control (R/W)</b><br>See Table 2-2.<br>See Section 14.7.2, "Thermal Monitor."  |
| 19CH             | 412 | IA32_THERM_STATUS     | <b>Thermal Monitor Status (R/W)</b><br>See Table 2-2.<br>See Section 14.7.2, "Thermal Monitor."   |
| 19DH             | 413 | MSR_THERM2_CTL        | Thermal Monitor 2 Control   |
|                  |     | 15:0                  | Reserved.   |
|                  |     | 16                    | <b>TM_SELECT (R/W)</b><br>Mode of automatic thermal monitor:<br>0 = Thermal Monitor 1 (thermally-initiated on-die modulation of the stop-clock duty cycle)<br>1 = Thermal Monitor 2 (thermally-initiated frequency transitions)<br>If bit 3 of the IA32_MISC_ENABLE register is cleared, TM_SELECT has no effect. Neither TM1 nor TM2 will be enabled.  |
|                  |     | 63:16                 | Reserved.   |
| 1A0H             | 416 | IA32_MISC_ENABLE      | <b>Enable Miscellaneous Processor Features (R/W)</b><br>Allows a variety of processor functions to be enabled and disabled.   |
|                  |     | 2:0                   | Reserved.   |
|                  |     | 3                     | <b>Automatic Thermal Control Circuit Enable (R/W)</b><br>1 = Setting this bit enables the thermal control circuit (TCC) portion of the Intel Thermal Monitor feature. This allows processor clocks to be automatically modulated based on the processor's thermal sensor operation.<br>0 = Disabled (default).<br>The automatic thermal control circuit enable bit determines if the thermal control circuit (TCC) will be activated when the processor's internal thermal sensor determines the processor is about to exceed its maximum operating temperature.<br>When the TCC is activated and TM1 is enabled, the processors clocks will be forced to a 50% duty cycle. BIOS must enable this feature.<br>The bit should not be confused with the on-demand thermal control circuit enable bit. |
|                  |     | 6:4                   | Reserved.   |

Table 2-49. MSRs in Pentium M Processors (Contd.)

| Register Address |     | Register Name      | Bit Description   |
|------------------|-----|--------------------|---|
| Hex              | Dec |                    |   |
|                  |     | 7                  | <b>Performance Monitoring Available (R)</b><br>1 = Performance monitoring enabled<br>0 = Performance monitoring disabled  |
|                  |     | 9:8                | Reserved.   |
|                  |     | 10                 | <b>FERR# Multiplexing Enable (R/W)</b><br>1 = FERR# asserted by the processor to indicate a pending break event within the processor<br>0 = Indicates compatible FERR# signaling behavior<br>This bit must be set to 1 to support XAPIC interrupt model usage.  |
|                  |     |                    | <b>Branch Trace Storage Unavailable (RO)</b><br>1 = Processor doesn't support branch trace storage (BTS)<br>0 = BTS is supported  |
|                  |     | 12                 | <b>Processor Event Based Sampling Unavailable (RO)</b><br>1 = Processor does not support processor event based sampling (PEBS);<br>0 = PEBS is supported.<br>The Pentium M processor does not support PEBS.   |
|                  |     | 15:13              | Reserved.   |
|                  |     | 16                 | <b>Enhanced Intel SpeedStep Technology Enable (R/W)</b><br>1 = Enhanced Intel SpeedStep Technology enabled.<br>On the Pentium M processor, this bit may be configured to be read-only.  |
|                  |     | 22:17              | Reserved.   |
|                  |     | 23                 | <b>xTPR Message Disable (R/W)</b><br>When set to 1, xTPR messages are disabled. xTPR messages are optional messages that allow the processor to inform the chipset of its priority. The default is processor specific.  |
|                  |     | 63:24              | Reserved.   |
| 1C9H             | 457 | MSR_LASTBRANCH_TOS | <b>Last Branch Record Stack TOS (R/W)</b><br>Contains an index (bits 0-3) that points to the MSR containing the most recent branch record. See also: <ul style="list-style-type: none"> <li>MSR_LASTBRANCH_0_FROM_IP (at 40H)</li> <li>Section 17.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)"</li> </ul> |
| 1D9H             | 473 | MSR_DEBUGCTLB      | <b>Debug Control (R/W)</b><br>Controls how several debug features are used. Bit definitions are discussed in the referenced section.<br>See Section 17.15, "Last Branch, Interrupt, and Exception Recording (Pentium M Processors)."  |

Table 2-49. MSRs in Pentium M Processors (Contd.)

| Register Address |      | Register Name      | Bit Description  |
|------------------|------|--------------------|--|
| Hex              | Dec  |                    |  |
| 1DDH             | 477  | MSR_LER_TO_LIP     | <b>Last Exception Record To Linear IP (R)</b><br>This area contains a pointer to the target of the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.<br>See Section 17.15, “Last Branch, Interrupt, and Exception Recording (Pentium M Processors)” and Section 17.16.2, “Last Branch and Last Exception MSRs.” |
| 1DEH             | 478  | MSR_LER_FROM_LIP   | <b>Last Exception Record From Linear IP (R)</b><br>Contains a pointer to the last branch instruction that the processor executed prior to the last exception that was generated or the last interrupt that was handled.<br>See Section 17.15, “Last Branch, Interrupt, and Exception Recording (Pentium M Processors)” and Section 17.16.2, “Last Branch and Last Exception MSRs.”                       |
| 2FFH             | 767  | IA32_MTRR_DEF_TYPE | <b>Default Memory Types (R/W)</b><br>Sets the memory type for the regions of physical memory that are not mapped by the MTRRs.<br>See Section 11.11.2.1, “IA32_MTRR_DEF_TYPE MSR.”   |
| 400H             | 1024 | IA32_MCO_CTL       | See Section 15.3.2.1, “IA32_MCi_CTL MSRs.”   |

## 2.21 MSRS IN THE P6 FAMILY PROCESSORS

The following MSRs are defined for the P6 family processors. The MSRs in this table that are shaded are available only in the Pentium II and Pentium III processors. Beginning with the Pentium 4 processor, some of the MSRs in this list have been designated as "architectural" and have had their names changed. See Table 2-2 for a list of the architectural MSRs.

Table 2-50. MSRs in the P6 Family Processors

| Register Address |     | Register Name    | Bit Description  |
|------------------|-----|------------------|--|
| Hex              | Dec |                  |  |
| 0H               | 0   | P5_MC_ADDR       | See Section 2.22, "MSRs in Pentium Processors."  |
| 1H               | 1   | P5_MC_TYPE       | See Section 2.22, "MSRs in Pentium Processors."  |
| 10H              | 16  | TSC              | See Section 17.17, "Time-Stamp Counter."   |
| 17H              | 23  | IA32_PLATFORM_ID | <b>Platform ID (R)</b><br>The operating system can use this MSR to determine "slot" information for the processor and the proper microcode update to load. |
|                  |     | 49:0             | Reserved.  |

Table 2-50. MSRs in the P6 Family Processors (Contd.)

| Register Address |     | Register Name  | Bit Description  |
|------------------|-----|----------------|--|

Table 2-50. MSRs in the P6 Family Processors (Contd.)

| Register Address |     | Register Name    | Bit Description  |
|------------------|-----|------------------|--|
| Hex              | Dec |                  |  |
|                  |     | 20               | <b>INT</b><br>Enables the signaling of counter overflow via input to APIC<br>1 = Enable<br>0 = Disable   |
|                  |     | 23               | <b>INV</b><br>Inverts the result of the CMASK condition<br>1 = Inverted<br>0 = Non-Inverted  |
|                  |     | 31:24            | <b>CMASK (Counter Mask)</b>  |
| 1D9H             | 473 | DEBUGCTLMR       | Enables last branch, interrupt, and exception recording; taken branch breakpoints; the breakpoint reporting pins; and trace messages. This register can be written to using the WRMSR instruction, when operating at privilege level 0 or when in real-address mode. |
|                  |     | 0                | Enable/Disable Last Branch Records   |
|                  |     | 1                | Branch Trap Flag   |
|                  |     | 2                | Performance Monitoring/Break Point Pins  |
|                  |     | 3                | Performance Monitoring/Break Point Pins  |
|                  |     | 4                | Performance Monitoring/Break Point Pins  |
|                  |     | 5                | Performance Monitoring/Break Point Pins  |
|                  |     | 6                | Enable/Disable Execution Trace Messages  |
|                  |     | 31:7             | Reserved   |
| 1DBH             | 475 | LASTBRANCHFROMIP | 32-bit register for recording the instruction pointers for the last branch, interrupt, or exception that the processor took prior to a debug exception being generated.  |
| 1DCH             | 476 | LASTBRANCHTOIP   | 32-bit register for recording the instruction pointers for the last branch, interrupt, or exception that the processor took prior to a debug exception being generated.  |
| 1DDH             | 477 | LASTINTFROMIP    | Last INT from IP   |
| 1DEH             | 478 | LASTINTTOIP      | Last INT to IP   |
| 200H             | 512 | MTRRphysBase0    | Memory Type Range Registers  |
| 201H             | 513 | MTRRphysMask0    | Memory Type Range Registers  |
| 202H             | 514 | MTRRphysBase1    | Memory Type Range Registers  |
| 203H             | 515 | MTRRphysMask1    | Memory Type Range Registers  |
| 204H             | 516 | MTRRphysBase2    | Memory Type Range Registers  |
| 205H             | 517 | MTRRphysMask2    | Memory Type Range Registers  |
| 206H             | 518 | MTRRphysBase3    | Memory Type Range Registers  |
| 207H             | 519 | MTRRphysMask3    | Memory Type Range Registers  |
| 208H             | 520 | MTRRphysBase4    | Memory Type Range Registers  |
| 209H             | 521 | MTRRphysMask4    | Memory Type Range Registers  |
| 20AH             | 522 | MTRRphysBase5    | Memory Type Range Registers  |

Table 2-50. MSRs in the P6 Family Processors (Contd.)

| Register Address |      | Register Name    | Bit Description  |
|------------------|------|------------------|--|
| Hex              | Dec  |                  |  |
| 20BH             | 523  | MTRRphysMask5    | Memory Type Range Registers  |
| 20CH             | 524  | MTRRphysBase6    | Memory Type Range Registers  |
| 20DH             | 525  | MTRRphysMask6    | Memory Type Range Registers  |
| 20EH             | 526  | MTRRphysBase7    | Memory Type Range Registers  |
| 20FH             | 527  | MTRRphysMask7    | Memory Type Range Registers  |
| 250H             | 592  | MTRRfix64K_00000 | Memory Type Range Registers  |
| 258H             | 600  | MTRRfix16K_80000 | Memory Type Range Registers  |
| 259H             | 601  | MTRRfix16K_A0000 | Memory Type Range Registers  |
| 268H             | 616  | MTRRfix4K_C0000  | Memory Type Range Registers  |
| 269H             | 617  | MTRRfix4K_C8000  | Memory Type Range Registers  |
| 26AH             | 618  | MTRRfix4K_D0000  | Memory Type Range Registers  |
| 26BH             | 619  | MTRRfix4K_D8000  | Memory Type Range Registers  |
| 26CH             | 620  | MTRRfix4K_E0000  | Memory Type Range Registers  |
| 26DH             | 621  | MTRRfix4K_E8000  | Memory Type Range Registers  |
| 26EH             | 622  | MTRRfix4K_F0000  | Memory Type Range Registers  |
| 26FH             | 623  | MTRRfix4K_F8000  | Memory Type Range Registers  |
| 2FFH             | 767  | MTRRdefType      | Memory Type Range Registers  |
|                  |      | 2:0              | Default memory type  |
|                  |      | 10               | Fixed MTRR enable  |
|                  |      | 11               | MTRR Enable  |
| 400H             | 1024 | MCO_CTL          | Machine Check Error Reporting Register - controls signaling of #MC for errors produced by a particular hardware unit (or group of hardware units).   |
| 401H             | 1025 | MCO_STATUS       | Machine Check Error Reporting Register - contains information related to a machine-check error if its VAL (valid) flag is set. Software is responsible for clearing IA32_MCI_STATUS MSRs by explicitly writing 0s to them; writing 1s to them causes a general-protection exception. |
|                  |      | 15:0             | MC_STATUS_MCACOD   |
|                  |      | 31:16            | MC_STATUS_MSCOD  |
|                  |      | 57               | MC_STATUS_DAM  |
|                  |      | 58               | MC_STATUS_ADDRV  |
|                  |      | 59               | MC_STATUS_MISCV  |
|                  |      | 60               | MC_STATUS_EN. (Note: For MCO_STATUS only, this bit is hardcoded to 1.)   |
|                  |      | 61               | MC_STATUS_UC   |
|                  |      | 62               | MC_STATUS_O  |
|                  |      | 63               | MC_STATUS_V  |
| 402H             | 1026 | MCO_ADDR         |  |
| 403H             | 1027 | MCO_MISC         | Defined in MCA architecture but not implemented in the P6 family processors.   |

**Table 2-50. MSRs in the P6 Family Processors (Contd.)**

| Register Address |      | Register Name | Bit Description  |
|------------------|------|---------------|--|
| Hex              | Dec  |               |  |
| 404H             | 1028 | MC1_CTL       |  |
| 405H             | 1029 | MC1_STATUS    | Bit definitions same as MCO_STATUS.  |
| 406H             | 1030 | MC1_ADDR      |  |
| 407H             | 1031 | MC1_MISC      | Defined in MCA architecture but not implemented in the P6 family processors.         |
| 408H             | 1032 | MC2_CTL       |  |
| 409H             | 1033 | MC2_STATUS    | Bit definitions same as MCO_STATUS.  |
| 40AH             | 1034 | MC2_ADDR      |  |
| 40BH             | 1035 | MC2_MISC      | Defined in MCA architecture but not implemented in the P6 family processors.         |
| 40CH             | 1036 | MC4_CTL       |  |
| 40DH             | 1037 | MC4_STATUS    | Bit definitions same as MCO_STATUS, except bits 0, 4, 57, and 61 are hardcoded to 1. |
| 40EH             | 1038 | MC4_ADDR      | Defined in MCA architecture but not implemented in P6 Family processors.             |
| 40FH             | 1039 | MC4_MISC      | Defined in MCA architecture but not implemented in the P6 family processors.         |
| 410H             | 1040 | MC3_CTL       |  |
| 411H             | 1041 | MC3_STATUS    | Bit definitions same as MCO_STATUS.  |
| 412H             | 1042 | MC3_ADDR      |  |
| 413H             | 1043 | MC3_MISC      | Defined in MCA architecture but not implemented in the P6 family processors.         |

**NOTES**

1. Bit 0 of this register has been redefined several times, and is no longer used in P6 family processors.
2. The processor number feature may be disabled by setting bit 21 of the BBL\_CR\_CTL MSR (model-specific register address 119h) to "1". Once set, bit 21 of the BBL\_CR\_CTL may not be cleared. This bit is write-once. The processor number feature will be disabled until the processor is reset.
3. The Pentium III processor will prevent FSB frequency overclocking with a new shutdown mechanism. If the FSB frequency selected is greater than the internal FSB frequency the processor will shutdown. If the FSB selected is less than the internal FSB frequency the BIOS may choose to use bit 11 to implement its own shutdown policy.

## 2.22 MSRS IN PENTIUM PROCESSORS

The following MSRs are defined for the Pentium processors. The P5\_MC\_ADDR, P5\_MC\_TYPE, and TSC MSRs (named IA32\_P5\_MC\_ADDR, IA32\_P5\_MC\_TYPE, and IA32\_TIME\_STAMP\_COUNTER in the Pentium 4 processor) are architectural; that is, code that accesses these registers will run on Pentium 4 and P6 family processors without generating exceptions (see Section 2.1, "Architectural MSRs"). The CESR, CTR0, and CTR1 MSRs are unique to Pentium processors; code that accesses these registers will generate exceptions on Pentium 4 and P6 family processors.

**Table 2-51. MSRs in the Pentium Processor**

| Register Address |     | Register Name | Bit Description  |
|------------------|-----|---------------|--|
| Hex              | Dec |               |  |
| 0H               | 0   | P5_MC_ADDR    | See Section 15.10.2, "Pentium Processor Machine-Check Exception Handling." |
| 1H               | 1   | P5_MC_TYPE    | See Section 15.10.2, "Pentium Processor Machine-Check Exception Handling." |
| 10H              | 16  | TSC           | See Section 17.17, "Time-Stamp Counter."                                   |
| 11H              | 17  | CESR          | See Section 18.6.9.1, "Control and Event Select Register (CESR)."          |
| 12H              | 18  | CTR0          | Section 18.6.9.3, "Events Counted."  |
| 13H              | 19  | CTR1          | Section 18.6.9.3, "Events Counted."  |

## 2.23 MSR INDEX

MSRs of recent processors are indexed here for convenience. IA32 MSRs are excluded from this index.

| MSR Name and CPUID DisplayFamily_DisplayModel        | Location       |
|--|----------------|
| MSR_ALF_ESCR0  |                |
| 0FH .....  | See Table 2-45 |
| MSR_ALF_ESCR1  |                |
| 0FH .....  | See Table 2-45 |
| MSR_ANY_CORE_C0                                      |                |
| 06_4EH, 06_5EH, 06_55H, 06_8EH, 06_9EH, 06_66H ..... | See Table 2-38 |
| MSR_ANY_GFXE_C0                                      |                |
| 06_4EH, 06_5EH, 06_55H, 06_8EH, 06_9EH, 06_66H ..... | See Table 2-38 |
| MSR_BO_PMON_BOX_CTRL                                 |                |
| 06_2EH .....   | See Table 2-16 |
| MSR_BO_PMON_BOX_OVF_CTRL                             |                |
| 06_2EH .....   | See Table 2-16 |
| MSR_BO_PMON_BOX_STATUS                               |                |
| 06_2EH .....   | See Table 2-16 |
| MSR_BO_PMON_CTR0                                     |                |
| 06_2EH .....   | See Table 2-16 |
| MSR_BO_PMON_CTR1                                     |                |
| 06_2EH .....   | See Table 2-16 |
| MSR_BO_PMON_CTR2                                     |                |
| 06_2EH .....   | See Table 2-16 |
| MSR_BO_PMON_CTR3                                     |                |
| 06_2EH .....   | See Table 2-16 |
| MSR_BO_PMON_EVTN_SELO                                |                |
| 06_2EH .....   | See Table 2-16 |
| MSR_BO_PMON_EVTN_SEL1                                |                |
| 06_2EH .....   | See Table 2-16 |

| MSR Name and CPUID DisplayFamily_DisplayModel | Location       |
|---|----------------|
| MSR_B0_PMON_EVNT_SEL2                         |                |
| 06_2EH .....                                  | See Table 2-16 |
| MSR_B0_PMON_EVNT_SEL3                         |                |
| 06_2EH .....                                  | See Table 2-16 |
| MSR_B0_PMON_MASK                              |                |
| 06_2EH .....                                  | See Table 2-16 |
| MSR_B0_PMON_MATCH                             |                |
| 06_2EH .....                                  | See Table 2-16 |
| MSR_B1_PMON_BOX_CTRL                          |                |
| 06_2EH .....                                  | See Table 2-16 |
| MSR_B1_PMON_BOX_OVF_CTRL                      |                |
| 06_2EH .....                                  | See Table 2-16 |
| MSR_B1_PMON_BOX_STATUS                        |                |
| 06_2EH .....                                  | See Table 2-16 |
| MSR_B1_PMON_CTRL0                             |                |
| 06_2EH .....                                  | See Table 2-16 |
